In offering education, it is important to strengthen the ties between different nations and to consider the variances between cultures so as to make the students more satisfied. Parrish and Linder-VanBerschot (2010) assume that different levels of culture exist within many structures including workplaces, family and community. This existence takes place not only at the regional level but also at the national and even international levels. This requires that teachers have to recognize the implications and consequences of culture on the teaching and learning environment. Nisbett (2003) reveals that teachers must be knowledgeable of their learners' culture to be able to interpret and analyze how those cultures demonstrate and manifest themselves in learning processes.

Hofstede (1980, 2001) and Hofstede and Hofstede (2005) developed a framework for describing cultural differences based on five value dimensions. These dimensions are high power distance versus low power distance, high uncertainty avoidance versus low uncertainty avoidance, individualism versus collectivism, masculinity versus femininity and long-term orientation versus short-term orientation. The development of these dimensions was done by a staff survey at IBM Corporation. Hofstede has lately added the sixth dimension which is indulgence versus restraint. According to the Hofstede (2015), indulgence "stands for a society that allows relatively free gratification of basic and natural human drives related to enjoying life and having fun. Restraint stands for a society that suppresses gratification of needs and regulates it by means of strict social norms."

According to Hofstede (2015), power distance dimension "expresses the degree to which the less powerful members of a society accept and expect that power is distributed unequally." Thus, in a society with high power distance, superiors are inaccessible by those inferior in positions while in a society with a low power distance, superiors are accessible and there is a feeling of equal distribution of power. Huq, Tyler and Schulhofer (2011) pointed out that individuals of various ethnicities recognize ways of interaction differently. What might be fair and acceptable in one ethnic group might not be fair and acceptable in another one in the lights of the expectancy of behaviors of an authoritative agency. This leads us to the notion that culture and ethnic groups might be perceived to conciliate outcomes of attitudes and individuals in societal reciprocity.

According to Hofstede (2015), uncertainty avoidance dimension "expresses the degree to which the members of a society feel uncomfortable with uncertainty and ambiguity." Individuals who live in a low uncertainty avoidance culture usually tend to prefer not to be bound by regulations and rules, so they prefer to be free. The opposite is true for people who live in a high uncertainty avoidance culture. The choices are not many for individuals. They either want to stay away from these situations by imposing firm behavioral norms and asserting values and beliefs in complete factuality or else they accept the new situations by changing the ruling regulations into flexible ones. Stress and anxiety are the main distinguishing characteristics of strong uncertainty avoidance cultures. Another characteristic is the urge to have written laws, regulations and rules. On the contrary, people in a weak uncertainty avoidance culture try to take risk and tolerate different situations of uncertainty. Moreover, there is a higher degree of acceptance to change, a higher degree of tolerance for differences in opinions and a greater preparation for exposure to danger.

2.2 Related Researches

2.2.1 Cultural Dimensions and Satisfaction

A number of studies used Hofstede's (1980) power distance dimension as a tool to examine the practices of business. Some of them aimed to examine the relationship between power distance and satisfaction. Cropanzano et al. (1997) observed that equality and power distance go in sharp contrast with each other. Interestingly and figuratively, he noted that the organization and its atmosphere will be poisoned if there is

injustice. Injustice inside organizations reduces the level of energy and increases the level of laziness. It means that the less the power distance the more the satisfaction is. Fock et al. (2013) studied the effects of power distance on some kinds of empowerment. They conducted their study on a number of employees from China and Canada. One of their findings indicated that the effect of the leadership empowerment on satisfaction was found to be more influential on low power distance (Canada) culture compared to high power distance (China) culture. Rafiei and Pourreza (2013) investigated the impact of power distance on the relationship between participation and a number of variables. Findings showed that there is a relationship between the level of power distance and job satisfaction.

Other studies aimed to examine the relationship between uncertainty avoidance and satisfaction. Häkkinen and Järvelä (2006) emphasized the significance of creating reciprocal understanding or common goals and values. It can be said that studies support an argument that a learner's uncertainty avoidance may have an influence on his learning experience but it does not give information about how this may affect his satisfaction. Karahanna et al. (2013) studied the impact of uncertainty avoidance on consumer perceptions and attitudes of e-loyalty. Results showed that uncertainty avoidance has an impact on information quality in relation to usefulness and e-loyalty. It is implied in this study that the more e-loyalty, the more satisfaction is. Reimann et al. (2008) indicated that customers vary in their level of satisfaction when there is a problem or defect in the service provided to them, especially when their expectations are not met. Customers who are from cultures with high level of uncertainty avoidance were less satisfied than customers who are from cultures with low uncertainty avoidance.

2.2.2 Cultural Dimensions and Other Related Issues

Many studies have aimed to examine or to expand upon Hofstede's (1980) principal findings. Cronjé (2010) concluded that three variables affect the cultures' roles when there is a conflict. These variables are communicative uncertainty reduction, shared meanings construction, and the appropriate usage of technology. Purohit and Simmers (2006) researched Hofstede's power distance dimension. They found that people from US, Nigeria, and India show different behavior patterns in terms of solving their administrative conflicts.

Rodrigues (2005), and Sulkowski and Deakin (2010) found that culture has a direct influence on learner's perceptions, expectations and preferences. This has been found to be related and reflected in whether they have a preference to be either active or passive, have more or less responsibility for learning, and prefer interaction with peers or teachers. Psychologists from several societies and organizations used power distance dimension of Hofstede. They clearly concluded that power distance measurements of individuals are so crucial to anticipate and understand people's societal behaviors. Among them are Tyler, Lind and Huo (2000) who proposed that measurement of respondents about conflict reconciliation procedures responses would interpret behavior. The same proposition is suggested by Farh et al. (2007) regarding workplace discerned institutional support. They recommended that investigators have to assess and analyze values of culture at the personal level. They have particularly placed a great importance to power distance. Zhang (2013) explored Chinese students' attitudes of power distance and its influence on their communication with teachers and peers in an online learning setting. It is found that teachers were seen by students as major sources of knowledge, having high power and possessing authority. Moreover, Chinese students who face some difficulties in learning were not feeling easy to communicate with teachers. Instead they preferred to ask assistance from peers who share similar linguistic and cultural background. Rahmat and Fayazi (2006) showed that power distance in institutions has a negative relationship with institutional loyalty and performance.

Sulimma (2009) mentioned that students who are high in UA prefer well-structured learning, show interest to get the right answers, expect that the teacher has the correct answers, and refer results to circumstances rather than confessing self-control for their learning. Deepwell and Malik (2008) postulated that students who are high in UA may have a tendency to take online learning because it depends on the learners being self-directed to finish assignments and to become more involved with various discussions and collaborations with peers, to have an access to library resources, research and development and to work on materials given by the tutors.

Mansoor and Tayib (2010) demonstrated that institutional culture has strong powerful influence on job satisfaction. Chang and Lee (2007) speculated that culture affects employees' job satisfaction. They also emphasized that a suitable culture in organizations increases job satisfaction of employees. Hence there is a strong positive correlation between culture and job satisfaction. Amos and Weathington (2008) emphasized that an appropriate organizational culture has a positive impact on employees, gives them satisfaction and increases their commitment to the organization.

Andreassi et al. (2012) examined the factors affecting job satisfaction across four-regional cultures. One of the findings of their study showed that differences do exist in relation to significance of job attributes on job satisfaction. Sabri et al. (2011) studied the effect of organizational culture on job satisfaction level of instructors working at institutes and universities in Lahore, Pakistan. Findings showed that there is a positive and significant relationship between organizational culture and job satisfaction. Ndubisi et al. (2012) researched culture's role in the association of quality of relationship with loyalty of customers. The results revealed that uncertainty avoidance has a significant association with loyalty. Broadly speaking, this shows that culture explains customer's loyalty. Richard et al. (2002) reported that processes that foster justice in organizations are crucial. They also emphasized that the way organizations deal with employees has an influence on attitudes, perceptions, feeling, beliefs, and behaviors. Kuh et al. (2005) explained that students' persistence, engagement and participation in learning will increase when resources and values of the institution enrich the students' educational experience.

2.3 Research Hypotheses

The research focuses on how students' power distance and uncertainty avoidance affect their satisfaction. Therefore, it is hypothesized that:

H1: There is a positive and significant relationship between high power distance and the satisfaction levels of university students.

H2: There is a positive and significant relationship between high uncertainty avoidance and the satisfaction levels of university students.

H3: Nationality, level of education and gender have a positive effect on the relationship between power distance and uncertainty avoidance and the satisfaction levels of university student.

3. Methodology

The study adopted a quantitative methodology. The paper used a sample in order to understand the students' satisfaction along Hofstede's cultural dimensions namely power distance and uncertainty avoidance. Because of using the random sample procedure, the data were transformed to standardized variables (Z-score) so as to overcome any problems in the estimated standard deviation. The following Z-score equation was used to provide an assessment of how off-target a process is operating:

$$Zscore_i = \frac{X_i + \mu_i}{\sigma}$$

Where; X_i is the standard score, μ_i is the mean of the population, and σ is the standard deviation of the population. Then, OLS robust model was applied to investigate the relationship between the exogenous variables and students' satisfaction. The formula was expressed as follows:

$$S_i = \beta_0 + \beta_1 PD_i + \beta_2 UV_i + \sum_{i=1}^{n=3} \beta_i (N_i, LE_i, G_i) + \varepsilon_i$$

Where; S_i: represents students' satisfaction, PD_i: represents power distance, UV_i: represents uncertainty avoidance, (N_i, LE_i, G_i): represents nationality, level of education, and Gender, andε_i: error term.

The researchers utilized both primary and secondary data. The primary data were collected from students of the eight universities in North Cyprus. The secondary data were obtained from books, journals and the

Internet. A random sample of 750 students from North Cyprus universities was selected. A total of 637 students provided responses. The response rate was 85%.

Students responded to a paper questionnaire that assessed power distance, uncertainty avoidance and students' satisfaction. Thus, the instrument of the research was composed of three scales. The first one was power distance scale of Hofstede (1980) which was composed of three items. The second scale was uncertainty avoidance scale of Hofstede (1980) which was composed of four items. The third scale is satisfaction scale of SurveyMonkey (2015) which is composed of fifteen items. These items were measured on a 5 point Likert scale. The reliability of the questionnaire was measured by Cronbach's Alpha coefficient. Another tool used for the analysis was Factor analysis in order to describe the correlated variables and variability among observation.

4. Results

4.1 Demographic Statistics

The data showed that 62% of the respondents were males, while 38% of them were females. It also showed that 59.5% of the respondents were undergraduates, while 40.5% of them were postgraduates. While the data showed that most of the respondents were from Nigeria with a percentage of 18.45%, and Turkey with a percentage of 14.9%, they showed that least of them were from India with a percentage of 0.9% and Lebanon 1.3%. Table 1 shows the frequency and percentages of the demographic variables.

Table 1. Sample Distribution of Demographic Variables

Variables		Frequency	Percentage
Gender	Male	395	62%
	Female	242	38%
	Total	**637**	**100%**
Educational Level	Undergraduate	379	59.5%
	Postgraduate	258	40.5%
	Total	**637**	**100%**
Nationality	Nigeria	117	18.45%
	Turkey	95	14.9%
	Iraq	51	8.0%
	Syria	48	7.5%
	Libya	47	7.4%
	North Cyprus	45	7.1%
	Russia	39	6.1%
	Turkmenistan	31	4.9%
	Zambia	30	4.7%
	Palestine	24	3.8%
	Rwanda	23	3.6%
	Jordan	20	3.1%
	Iran	19	3.0%
	Egypt	14	2.2%
	Somalia	10	1.6%
	Ghana	10	1.6%
	Lebanon	8	1.3%
	India	6	0.9%
	Total	**637**	**100%**

4.2. Factor Analysis - Measure of Sampling Adequacy

Bartlett's test has been employed for the power distance group of questions. It is found that the approx. Chi-Square is 40.482, the degree of freedom is 3.00, and significance is 0.000. Findings show that the value of the Kaiser-Meyer-Olkin Measure of sampling adequacy (KMO) is 0.569. This result shows that the data were adequate for factor analysis. Bartlett's test has also been used for the uncertainty avoidance group of questions. It is found that the approx. Chi-Square is 125.087, degree of freedom is 6.00, and significance is 0.000. Results show that the value of Kaiser-Meyer-Olkin Measure of sampling adequacy (KMO) is 0.643. This result also shows that the data were adequate for factor analysis (Hutcheson and Sofroniou, 1999).

Bartlett's test has finally been employed for the satisfaction group of questions. It is found that the approx. Chi-Square is 750.493, degree of freedom is 120.00, and significance is 0.000. Findings show that the value of Kaiser-Meyer-Olkin Measure of sampling adequacy (KMO) is 0.772. This finding shows that the data were adequate for factor analysis. 15 factors have been extracted. Out of them 2 items have been excluded due to the value of factor loading which was less than 0.5.

According to factor Analysis table, all the variables are well fitted in factor solution. This is because most of the factors have loading value more than 0.50 except 2 items in the group questions of satisfaction. The result of factor analysis gives evidence to the proper use of the instrument which measures the variables of power distance and uncertainty avoidance and allows to proceed for data collection. The reliabilities of the scales were tested by performing the Cronbach’s Alpha reliability statistics. Results were more than 75% (power distance: 0.771, Uncertainty avoidance: 0.818 and satisfaction: 0.763) which indicate the high reliability of the present measure of the scales. Factor analysis table shows that the determinant is more than 0.00001. This indicates the absence of multicollinearity. Table 2 shows the factor analysis results. (See appendix 1).

4.3 Testing of Hypotheses

The multiple regression analyses were performed on the mean scores data collected from the respondents. In model 1, the R Square value is 0.825 which means that dimensions of power distance and uncertainty avoidance account for 82.5% of the variation in students’ satisfaction. The adjusted R square value is 0.825 which is the same as R Square, which means that this model is acceptable (See Table 3).

Table 3. Model Summary of Multiple Regression Analyses.

Dependent Variable Students' Satisfaction	**Robust Model**											
Independent variables	**Model 1**			**Model 2**			**Model 3**			**Model 4**		
	β	***Collinearity Diagnostics***		***β***	***Collinearity Diagnostics***		***β***	***Collinearity Diagnostics***		***β***	***Collinearity Diagnostics***	
		Tolerance	**VIF**		**Tolerance**	**VIF**		**Tolerance**	**VIF**		**Tolerance**	**VIF**
Constant	**0.002 (0.007)**	----	----	**0.007 (0.012)**	----	----	**-0.010 (0.020)**	----	----	**-0.031 (0.029)**	----	----
Power Distance	**-0.017 (0.011)**	0.996	1.004	**-0.017 (0.011)**	0.992	1.008	**-0.017 (0.011)**	0.992	1.008	**-0.017 (0.011)**	0.991	1.009
Uncertainty Avoidance	**0.982 (0.018)*** **	0.996	1.004	**0.982 (0.018)*** **	0.993	1.007	**0.980 (0.018)*** **	0.981	1.020	**0.979 (0.018)*** **	0.980	1.021
Nationality				**-0.001 (0.002)**	0.994	1.006	**-0.001 (0.002)**	0.991	1.009	**-0.001 (0.002)**	0.991	1.009
Level of Education							**0.010 (0.001)**	0.985	1.015	**0.011 (0.001)**	0.984	1.017
Gender										**-0.030 (0.015)** **	0.997	1.003
No of respondents	**637**			**637**			**637**			**637**		
R square	0.825			0.825			0.826			0.827		
Adjusted R square	0.825			0.824			0.825			0.825		
F-test	1494.344***			995.176***			598.444***			601.096***		
Durbin-Watson	1.902			1.911			1.912			1.908		

** and *** denote significant level at P < 0.05 and P < 0.01respectively. Based on Standard errors are in parentheses. **Note**: Durbin-Watson of residuals test indicates that the residual does not display any serial correlation.

The value of F-test is 1494.344. This means that it is highly significant ($p \leq 0.0001$). The coefficient value for the power distance variable is -0.017 which is not significant. Therefore, the variable of high power distance does not affect the students' satisfaction. On the contrary, the coefficient value for uncertainty avoidance variable is 0.982 which is significant. Thus, the variable of high uncertainty avoidance is positively and significantly related to students' satisfaction.

In terms of collinearity diagnostics, the value of tolerance in model 1 is 0.996 for both power distance and uncertainty avoidance. This result confirms the absence of perfect multi-collinearity since it is more than 0.02. Both variables also share the variance inflation factor (VIF) value which is 1.004. This value is less than 5.00. Hence, it shows that there is no multicollinearity between the independent variables (power distance and uncertainty avoidance). Each one of them has a distinct relationship with the dependent variable (students' satisfaction). The value of Durbin-Watson test in all models indicates "white noise residual", which means that there is no autocorrelation.

The Robust Model takes into consideration to analyze the impacts of the demographic variables namely country, gender and educational level on the variables of power distance and uncertainty avoidance with their relationship with the variable of students' satisfaction. Results show almost the consistency of the R Square in all models: 0.825 for Model 2, 0.826 for Model 3, and 0.827 for Model 4. Considering the hypotheses of the research, this is an indication that the sample has approximately the same cultural characteristics in terms of power distance and uncertainty avoidance.

5. Discussion and Conclusion

Most of the students in North Cyprus are from Turkey, African Countries, Arab countries and Asian countries. Regarding power distance and uncertainty avoidance, almost all of these countries score high on power distance and uncertainty avoidance dimension of Hofstede 1980. It can be implied that variations do not exist on the studied sample.

Findings of this research showed that there is no statistically significant relationship between high power distance and students' satisfaction ($p < 0.05$). This result is consistent with the results of other researchers conducted over the previous years (Cropanzano et al., 1997; Fock et al., 2013; Rafiei and Pourreza, 2013). The findings of these researches confirmed that low power distance in organizations is linked to higher degree of satisfaction. It can be stated that students' satisfaction is not strengthened by the increase or decrease of power distance. It seems that students consider other factors as influential of their levels of satisfaction. One of these factors could be the quality of the teaching staff. It is assumed that the teaching staff play a crucial rule in the level of students' satisfaction. Other factors may be library resources, IT assistance, psychological comfort, rewards of study, support services, and general life satisfaction. In investigating the relationship between high power distance dimension, students' satisfaction and students' demographic factors and variables, the results showed no statistically significant relationship. The reason for this may be attributed to the great number of students who come from high power distance countries to study in North Cyprus universities and the lack of students who come from low power distance countries. Therefore, H1 is not supported.

The results of the research indicated that there is a statistically significant relationship between high uncertainty avoidance and students' satisfaction ($p < 0.05$). This result is almost consistent with the results of other researchers conducted during the previous years (Häkkinen and Järvelä, 2006; Karahanna et al., 2013; Reimann et al., 2008). The result means that students who have high uncertainty avoidance levels in North Cyprus universities are more satisfied. This result suggests that university students in North Cyprus have availability of clear procedures, policies and regulatory framework that guide their academic life in North Cyprus. It can also be implied that students do not consider academic life in North Cyprus as vague, and that most of their expectations are met. In other words, students do not find it difficult to adapt to the existing culture. In investigating the relationship between high uncertainty avoidance dimension, students' satisfaction and students' demographic factors and variables, the results showed no statistically significant

relationship. The reason for this may also be attributed to the great number of students who come from high uncertainty avoidance countries to study in North Cyprus universities. Therefore, H2 is supported.

However, management and lecturers of North Cyprus universities need to be very formal when dealing with their students. They have to clearly formulate laws, rules, procedures, and polices. It is advisable that those universities leave nothing unclear or unexplained. This is important because not doing so would result in a serious challenge to the students' levels of satisfaction. It can also be said that failure by universities' managements in North Cyrus to consider cultural differences of students especially uncertainty avoidance dimension leads to decreased levels of satisfaction.

As the demographic variables of nationality, level of education and gender have no positive effect on the relationship between power distance and uncertainty avoidance and the satisfaction levels of university student, it is concluded that H3 is not supported.

To conclude, the findings of the study showed some differences between students from different cultures in terms of their level of satisfaction towards the universities in North Cyprus. These differences regarding cultural values may have various implications to universities' administrations. Raising the level of understanding of these cultural variations especially power distance and uncertainty avoidance dimensions would contribute to develop more effective learning/teaching strategies, and would improve the abilities of universities to satisfy students who come from multi-cultural communities. Therefore, the researchers recommend that decision makers in North Cyprus universities should take into consideration the cultural dimensions in order to raise the level of students' satisfaction of their universities.

This research added evidence to the existing literature, and contributed to current understanding of power distance and uncertainty avoidance and their relation to satisfaction. Future studies could focus on other aspects of cultural influence on students' satisfaction. For instance, researches can focus on addressing the complex issue of students' satisfaction from all its perspectives. Other researches can also replicate this study in different countries, together with studying all Hofstede cultural dimensions and their impact on satisfaction.

On Value-At-Risk and Conditional Jump Dynamics: An Application on Nasdaq Stock Market

Raoudha Louafi, Higher Institute of Management of Tunis, Tunis, Tunisia, louafi_isg@yahoo.fr
Pr. Ali Chebbi, Department of Quantitative Methods and Economy in Higher Institute of Management, University of Tunis, Tunisia, alicheb@yahoo.fr

Abstract

We consider the problem of managing risk in stock market. The Value at Risk (VaR) metric, a widely reported and accepted measure of financial risk, requires accurate estimation of volatility and a corresponding quantile of the empirical distribution. Current researches usually use GARCH type models with normal distribution. However, in this article a GARCH-jump mixture and an Autoregressive-conditional-Jump-Intensity (ARJI–GARCH) models, are used to describe stock price movement and are compared with standard GARCH model to verify the best VaR forecast model for Nasdaq stock index. Normal and Generalized-Error-Distribution (GED) distributions are adopted to describe the diffusion process and heavy tails. We use the unconditional and conditional coverage tests to evaluate the accuracy of VaR forecasting models. Through the GARCH and Jump methodology, empirical results of Nasdaq stock indices on the period from 1 January 2000 to 28 July 2011 provide evidence of conditional Jump dynamics in Nasdaq returns. Another interesting result is that the Jump Garch and the ARJI models perform GARCH models and that GED distribution is more suitable for high confidence level (99%).

Keywords: value at risk (VaR); conditional jumps; GARCH; forecasting.

Introduction

VaR is defined as an estimate of how much a portfolio can lose within a given time period, for a given confidence-level. Widely used by managers in the banking industry and portfolio, and by credit rating agencies, an appropriate VaR measure is an important task. A practical assumption usually made is that returns of financial assets follow a normal distribution. Because of the lack of symmetry in the yields distribution in most markets, this assumption has been proven invalid (Jansen and de Vries, 1991). Calculating VaR under the normal assumption underestimates the actual risk.1 Then, alternative distributions such as Student distribution (Jorion, 2006), skewed-Student distribution (Hansen, 1994), or GED distribution (Liu and Hung, 2010) have been proposed and implemented to build risk models of financial returns. Vee et al. (2011) point that the GED errors outperform student errors in forecasting out of-sample volatility. In order to capture the propriety of heavy tails, the GED is adopted.

Furthermore, it is well known that financial returns of most financial assets exhibit volatility clustering. Most literature dealing with parametrics VaR focuses on the volatility models are based on Garch framework (Bollerslev, 1986).2 Those models are able to describe the clustering and the heteroskedasticity of returns. However, due to financial crisis and stock market crash, when sudden and large price changes happen, the adequacy of the GARCH models patently cannot be guaranteed.

Extreme news events, such as crashes, terrorist attacks, are rare but when they occur they are catastrophic. Over the last three decades, the Wall-Street-crisis (1987), the Asian-financial-crisis (1997), the global-financial-crisis (2008) and the tsunami-crisis (2011) have attracted much researchers attention. The significance influences of news arrival process on financial markets are proved.3

[1] See Zangari (1996).

[2] Various variants of GARCH model have been developed to model volatility (IGARCH, EGARCH and TGARCH).

[3] See (Andersen, 1996; Jones *et al*., 1994).

Andersen and Lund (1996) found that more than two types of news occurrence process have different implications for stocks market returns. Maheu and McCurdy (2004) confirm that two types of news events, namely, normal and extreme news events exist. Since Poisson process is assumed to be suitable for describing rare event properly, it was introduced to financial engineering domain for asset pricing. Press (1967) was the first that used the Poisson process to describe jump behaviour. Ball and Torous (1983) modelled the impact of jumps in stock prices by assuming a Poisson distribution for discrete movements and a Bernoulli jump distribution for continuous movements. Results suggest that the Poisson distribution governs the number and the frequency of events that result in price movement. Latter, a GARCH-jump mixture model that incorporates jump processes into GARCH-type framework and that allows normal and extreme news events to be modelled is developed (Nieuwland et al., 1994). In this model, jump intensity, which refers to the arrival rate of jumps, is usually assumed as a constant. To overcome this defect, Chan and Maheu (2002) propose the ARJI model, in which the intensity of conditional jumps is time varying and follows an Autoregressive-Moving-Average (ARMA) process. Since its introduction the ARJI model has been used to investigate the behaviours of financial assets (Maheu and McCurdy, 2004; Chiou and Lee, 2009). But few previous studies have been conducted to estimate the VaR for the stock market and studied the influence of the price jump.

The present investigation on the Nasdaq stock indices on the period from 1 January 2000 to 28 July 2011, considers both constant and dynamic intensity Jumps models. The aim is to compare the performance of the ARJI model proposed by Chan and Maheu (2002) to the JUMP-Garch and Garch models in VaR estimation. We initially test the presence of jumps in the Nasdaq stock market returns and investigate whether returns exhibit constant or dynamic jumps. We use Garch models with jumps specifications to model the time varying volatility and the jump intensity. We take into account the excess kurtosis in stock returns by assuming two distributions for returns innovation. Then, we examine relative out of sample predictive ability of different jump GARCH models that is evaluated in VaR calculation. Finally, we use backtesting procedures for the evaluation of the statistical accuracy of the VaR models.

The remainder of the article proceeds as follows. Section II outlines the VaR models and backtesting methodologies which are employed in the article. Section III provides data and empirical results for both the in-sample and the out-of-sample analysis and VaR evaluation. Section IV concludes.

Methodology

We consider the application of JUMP and ARJI-GARCH models with normal and GED distributions to estimate the corresponding volatility and quantile of the empirical distribution for VAR calculations.

Jump-garch and ARJI garch models: a survey
According to the work of Chan and Maheu (2002), the autoregressive conditional jump intensity model shows that the jump intensity obeys an ARMA process and incorporates the GARCH effect of financial returns series.

Let $$R_t = 100(\ln S_t - \ln S_{t-1}) \quad (1)$$

where S_t is the stock price, r_t denotes the daily returns of the underlying assets on time t and Ω_{t-1} is the information set of all observed returns up to time $t-1$. The mean equation of the Jump model is,

$$R_t = \mu_t + \sum_{i=1}^{p} \phi_i R_{t-1} + \varepsilon_{1,t} + \varepsilon_{2,t} \quad (2)$$

Two independent stochastic innovations were considered in the returns process. The first we model using a normal innovation then using a GED distribution. The second is the jump innovation

representing a compound Poisson process accounting for 'abnormal' volatilities due to extreme events.

$\varepsilon_{1,t}$ is a mean-zero innovation with a normal stochastic process, and it connoted the latest normal information. This process is defined as:

$$\varepsilon_{1,t} = \sqrt{h_t} Z_t, \qquad Z_t \sim \text{NID}(0,1) \tag{3}$$

where h_t is the conditional variance parameterized as a GARCH(1,1), and presented as function of the previous return innovation $\varepsilon_{1,t}$ as,

$$h_t = \omega + \alpha \varepsilon_{t-1}^2 + \beta h_{t-1} \tag{4}$$

where ω, α, β are nonnegative parameters with α + β <1 to ensure the positive of conditional variance and stationarity.

The jump stochastic process ($\varepsilon_{2,\,t}$) is assumed to be Poisson distribution:

$$\varepsilon_{2,\,t} = \sum_{k=1}^{n_t} X_{t,k} \tag{5}$$

The conditional jump size $X_{t,k}$ given the history of observations Ω_{t-1}, is assumed to be normally distributed with mean θ_t and variance, δ_t^2: $X_{t,k} \sim N(\theta_t, \delta_t^2)$.

Let n_t describes the discrete counting process governing the number of jumps that arrive over the interval $[t-1,\ t]$, which is distributed as a Poisson random variable with the parameter $\lambda_t > 0$. The conditional density of λ_t is,

$$P(n_t = j|\Omega_{t-1}) = \frac{exp\ (-\lambda_t)\lambda_t^j}{j!}, \quad j = 0,1,2 \ldots \tag{6}$$

The mean of a Poisson distributed random variable is equal to λ_t and so is its variance. In the literature this parameter is referred to the jump 'intensity'.

Two variants of the model are considered here: a constant jump-intensity model that assumes that knowledge of information set at time $t-1$ implies knowledge of λ_t, that is a constant jump intensity ($\lambda_t = \lambda$) and a constant jump size distribution ($\theta_t = \theta,\ \delta_t^2 = \delta^2$). The second one allows the jump intensity λ_t to be dynamic and is called the ARJI model. The later is discussed bellow.
Chan and Maheu (2002) proved that observed jumps intensity in returns may be very different over time. To explore the importance of time variation in the jump intensity, a single specification of the jump component is applied. In ARJI-GARCH models, the conditional jump intensity λ_t which is the expected number of jumps conditional on the information set Ω_{t-1}, is specified as an ARMA (1,1) process:

$$\lambda_t = \lambda_0 + \rho\lambda_{t-1} + \gamma\zeta_{t-1} \tag{7}$$

where ζ_{t-1} represents the innovation to λ_{t-1} and measures the unexpected forecast of λ_{t-1} as the information set is updated. It is defined as:

$$\zeta_{t-1} \equiv \text{E}[n_{t-1}|\Omega_{t-1}] - \lambda_{t-1} = \left[\sum_{j=0}^{\infty} jP(n_{t-1} = j|\Omega_{t-1})\right] - \lambda_{t-1} \tag{8}$$

where $P(n_{t-1} = j|\Omega_{t-1})$, called the filter, is the ex-post inference on n_{t-1} given the information set Ω_{t-1}, $E(n_{t-1}|\Omega_{t-1})$ is the ex-post judgment of the expected number of jumps from $t-2$ to $t-1$ and λ_{t-1} is the conditional expectation of n_{t-1} given the information set Ω_{t-2}.

From the Equation 8, ξ_{t-1} is a martingale difference sequence with respect to information set Ω_{t-1}. Thus $E(\zeta_t) = 0$ and $\mathrm{Cov}(\zeta_t, \zeta_{t-\mathrm{i}}) = 0, \mathrm{i} > 0$. Accordingly, the intensity residuals in a specified model should not exhibit any autocorrelation. The GARCH–ARJI model can therefore be rewritten as follows:

$$\lambda_t = \lambda_0 + (\rho - \gamma)\lambda_{t-1} + \gamma E[n_{t-1}|\Omega_{t-1}] \quad (9)$$

where $\lambda_t > 0, \lambda_0 > 0, \rho \geq \gamma, \gamma \geq 0$.

The conditional variance of returns is decomposed into: a smoothly developing conditional variance component related to the diffusion of past news impacts and the conditional variance component associated with the heterogeneous information arrival process which generates jumps. That is:

$$\begin{aligned} \mathrm{Var}(R_t|\Omega_{t-1}) &= \mathrm{Var}\left(\varepsilon_{1,t-1}\middle|\Omega_{t-1}\right) + \mathrm{Var}\left(\varepsilon_{2,t-1}\middle|\Omega_{t-1}\right) \\ &= h_t \\ &+ (\theta^2 + \delta^2)\lambda_t \end{aligned} \quad (10)$$

Also, the conditional mean of returns is:

$$\mathrm{E}(R_t|\Omega_{t-1}) = \mu + \sum_{i=1}^{l} \phi_i R_{t-i+} \theta \lambda_t \quad (11)$$

Let $f(R_t|n_t) = j, \Phi_{t-1}$ denote the conditional density of returns given the information set Φ_{t-1} and that j jumps occur. Having observed R_t and using the Bayes rule, we can infer the ex-post probability of the occurrence of j jumps at time t, with the filter defined as the conditional density of returns,

$$P(n_t = j|\Omega_t) = \frac{f(R_t|n_t = j, \Omega_{t-1})P(n_t = j|\Omega_{t-1})}{P(R_t|\Omega_{t-1})}, \qquad j = 0,1,2 \ldots \quad (12)$$

After integrating out all jumps during a one-unit interval, the conditional probability density function may be expressed as:

$$f(R_t|\Omega_{t-1}) = \sum_{j=0}^{\infty} f(R_t|n_t = j, \Omega_{t-1})P(n_t = j|\Omega_{t-1}) \quad (13)$$

Two conditional distributions for the error term $\varepsilon_{1,t}$ are considered. The first is a standard normal distribution. The second is a GED distribution. This is used to investigate the influence of fat tailed innovation process on the performance of the of one-day-ahead VaR estimate. The density function of the standard normal distribution is presented as follows,

$$f(z) = (2\pi)^{-1/2} exp(-z_t^2/2) \quad (14)$$

Under the normality assumption the conditional density of returns given that *j* jumps occur is:

$$f(R_t|n_t = j, \Omega_{t-1}) = \frac{1}{\sqrt{2\pi(h_t + j\delta^2)}} \times exp\left[-\frac{(R_t - \mu - j\theta)^2}{2(h_t + j\delta^2)}\right] \quad (15)$$

Therefore, the likelihood function of the ARJI with normally distributional errors (hereafter, GARCH-N) can be derived as,

$$\mathrm{L}(\psi) = \sum_{\mathrm{T}+1}^{\mathrm{T}} \log \mathrm{P}(\mathrm{R_t}|\Omega_{\mathrm{t-1}};\ \psi) \quad (16)$$

where $\psi = (\mu, \omega, \alpha, \beta, \theta, \delta, \eta_0, \rho, \gamma)$ is the vector of parameters to be estimated and $\Omega_{t-1}$is the information set of all observed returns up to time $t - 1$.

The probability density function for the standardized GED distribution is expressed as follows:

$$f(z_t) = \frac{\kappa}{B2^{1+1/\kappa}\,\Gamma(1/\kappa)} exp\left(-\frac{1}{2}\left|\frac{z_t}{B}\right|^{\kappa}\right) \quad (17)$$

Under the GED distribution assumption the conditional density of returns given that j jumps occur is:

$$f(R_t|n_t = j, \Omega_{t-1}) = \frac{\kappa}{B2^{1+1/\kappa}\,\Gamma(1/\kappa)\sqrt{h_t + j\delta^2}} \times exp\left[-\frac{1}{2}\left|\frac{R_t - \mu - j\theta}{B\sqrt{h_t + j\delta^2}}\right|^{\kappa}\right] \quad (18)$$

Hence, the log-likelihood function of the ARJI-GED model can be derived as:

$$L(\psi) = \sum_{T+1}^{T} \log P(R_t|\Omega_{t-1};\ \psi) \quad (19)$$

where $\psi = (\mu, \omega, \alpha, \beta, \theta, \delta, \eta_0, \rho, \gamma, \kappa)$ is the vector of parameters to be estimated.

Value-at-risk forecasts

VaR is defined as the maximum amount of money that a portfolio may lose over a given forecast horizon and at the given confidence-level $\alpha = 1 - c$ (e.g. $\alpha = 0.95$). Mathematically:

$$\text{VaR} = F^{-1}(\alpha) = \int_{-\infty}^{VaR} f(r)dr = p(r \leq \text{VaR}) = \alpha \quad (20)$$

where r_t is the portfolio return at time t and $f(r)$ is the marginal probability function for r_t (i.e.$r_t \sim f_t(r)$).

Under normal distribution and conditional ARJI, the one-step-ahead VaR is defined as follow:

$$\text{VaR}_{t+1|t}^{\text{ARJI-N}} = \hat{\mu}_{t+1} + \hat{\lambda}_{t+1|t}\theta + q(z_t; c)\sqrt{\hat{h}_{t+1|t} + (\theta^2 + \delta^2)\hat{\lambda}_{t+1|t}} \quad (21)$$

where $\hat{\mu}_{t+1}$, $\hat{\lambda}_{t+1|t}$ and $\hat{h}_{t+1|t}$ are one-step-ahead forecasts of the mean, the jump intensity and the variance of the returns conditional on all information upon the time t, respectively. $q(z_t, c)$ is the c^{th} left quantile of the standardized normal distribution and is time invariant. ARJI-N model degenerates into Jump-Garch-N model under restrictions of $\lambda_t = \lambda$ and $\theta_t = \theta$, $\delta_t^2 = \delta^2$. Moreover, for the Garch-N model we added the following restrictions; $\theta = \delta = \lambda_0 = \rho = \gamma = 0$.

Under the GED distribution, the one-step-ahead VaR is calculated as follow:

$$\text{VaR}_{t+1|t}^{\text{ARJI-N}} = \hat{\mu}_{t+1} + \hat{\lambda}_{t+1|t}\theta + q(z_t; \kappa, c)\sqrt{\hat{h}_{t+1|t} + (\theta^2 + \delta^2)\hat{\lambda}_{t+1|t}} \quad (22)$$

Note that $q(z_t; \kappa, c)$ is the left quantile at c% for the standardized GED distribution with shape parameter κ. To ensure the steadiness of the results, we specify the significant levels to 10%, 5% and 1% respectively.

Backtesting the methods

VaR model is efficient if it can forecast risk accurately. Backtesting is a well-established tool for the evaluation of the statistical accuracy of the VaR models.
In this article the performance assessment of VaR models is done by computing the empirical failure rate and performing the unconditional and conditional coverage tests.

Unconditional coverage tests (LR_{UC}). Let $H_t = I\big(R_t < VaR_t(c)\big)$ denote a hit sequence where $I(\cdot)$ is an index function that takes one if an occurrence of the returns is less than the forecasted VaR and

zero otherwize. Then, given the back-test interval T, the sum of the value of the hit sequence N is the number of the VaR violations, while N/T is the failure rate of this interval. We denote $\hat{\pi} = N/T$ the failure rate. If a VaR model truly provides the level of coverage defined by its confidence-level, then the failure rate over the full sample will equal to c for the $(1-c)$ confidence-level.

If the VaR model is accurate, given the significant level c, H_t will be Bernoulli distributed with probability α while the number of the VaR violations N will be binomial distributed with probability αand likelihood function, $L(N)$ such that,

$$L(N) = \binom{T}{N} \alpha^N (1-\alpha)^{T-N} \tag{23}$$

Kupiec (1995) tests the null hypothesis that the observed violation rate is statistically equal to the expected violation rate, α. The appropriate likelihood ratio is represented as follows:

$$LR_{uc} = -2\ln\left(\frac{\alpha^N(1-\alpha)^{T-N}}{\hat{\pi}^N(1-\hat{\pi})^{T-N}}\right) \tag{24}$$

which is asymptotically distributed as $\chi^2(1)$.

Conditional coverage test ($\mathbf{LR_{cc}}$). Christoffersen's(1998) conditional coverage statistic examined the null hypothesis that the VaR failures occur independently, and spread across the whole estimation period, against the alternative hypothesis that the failures are clustered together. This is tested by the likelihood ratio statistic:

$$\begin{aligned} LR_{cc} &= LR_{uc} + LR_{ind} \\ &= -2ln\left(\frac{\alpha^N(1-\alpha)^{T-N}}{\hat{\pi}_{01}^{N_{01}}(1-\hat{\pi}_{01})^{N_{00}}\hat{\pi}_{11}^{N_{11}}(1-\hat{\pi}_{11})^{N_{10}}}\right) \end{aligned} \tag{25}$$

where $N_{i,j}, i,j = 0,1$ is the number of observations with value i following by j, $\pi_{i,j} = P\{I_t = j | I_{t-1} = i\}$, $\hat{\pi}_{01} = N_{01}/(N_{00}+N_{01})$ and $\hat{\pi}_{11} = N_{11}/(N_{10}+N_{11})$. LR_{cc} is asymptotically distributed as $\chi^2(2)$.

Empirical Analysis

Data

Our empirical investigation is conducted on a daily data sample of Nasdaq stock market index for the period from 1 January 2000 to 28 July 2011, yielding a total of 3018 observations. The stock indices returns are defined as 100 times the first difference in the logarithm of the closing spot prices of the Nasdaq index. In Fig. 1, descriptive graphs of levels of spot price and density against normal distribution are given in (a), while returns and density against normal distribution are given in (b). Levels graph shows that series does not have a constant variance. The volatility clustering feature is seen graphically in (b) from the presence of sustained periods of high or low volatility.[4]

[4] Volatility clustering: large changes tend to be followed by large changes and small changes tend to be followed by small changes.

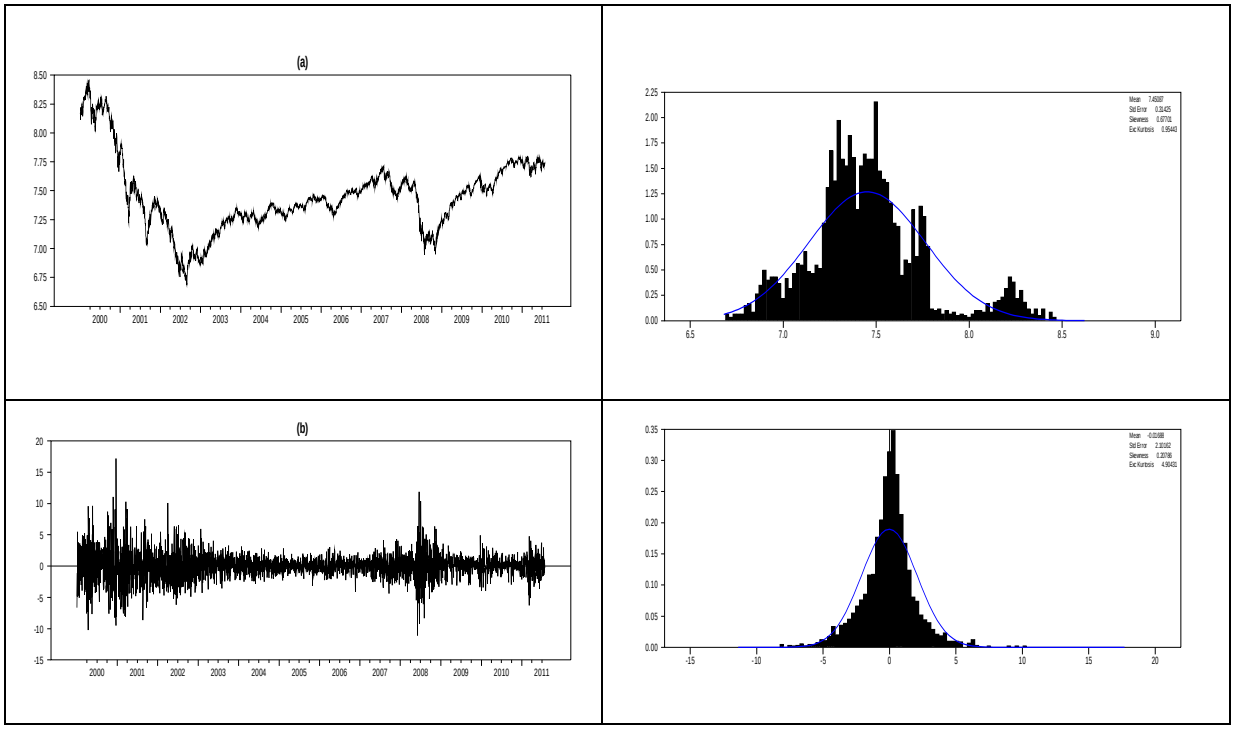

Fig 1. Spot prices and returns of the Nasdaq index

Density return graph combined with a normal distribution curve shows fatter tails and a higher peak around the mean. The sample is split in estimation and evaluation sample. We use 2715 observations (from 4-January-2000 to 31-May-2010) to estimate the models and reserve the last 303 observations (from 1-June-2010 to 28-July-2011) for out-of-sample evaluation of the models.

Table 1. Descriptive statistics for daily Nasdaq returns

	obs.	Mean	SD	Skewness	kurtosis	J–B	Q(20)
Panel A. full period (3018-observations)							
R_t	3018	-0.0168	2.1016	0.2078c	7.9043c	3046.3075c	110.947c
R_{2t}	3018	4.4156	11.5898	9.3920c	164.6324c	3 329 593.2535c	2650.394c
Panel B. Estimation period (2715 observations)							
R_t	2715	-0.0222	2.1654	0.2279c	7.6917c	2513.6549c	108.546c
R_{2t}	2715	4.6879	12.1100	9.0725c	152.7101c	2 572 730.8400c	2316.118c
Panel B. Forecast period (303 observations)							
R_t	303	0.0316	1.4074	-0.4056c	6.5263c	88.8872c	33.173b
R_{2t}	303	1.9752	4.1626	4.7859c	33.5063c	12 906.0390c	171.357c

Notes:[a] a, b and c denote significance at the 10%, 5% and 1% levels, respectively.
[b]J–B statistics are based on Jarque and Bera and are asymptotically chi-squared distributed with 2 degrees of freedom
[c]Q2(20) denotes the Ljung–Box *Q*-test for 20th order serial correlation of the squared returns.

Table 1 show that the average daily returns are negative in the whole and estimation periods but positive in forecast period. The time series features notably higher volatility throughout the

estimation period compared to the variance for forecast period. For all periods, estimated kurtosis are very large. This denotes a fat-tailed distribution. There is a significant positive skewness for the whole and the estimation period. In particular, the observed negative skewness coefficients for the forecast period imply that long positions are associated with greater risk since more extreme losses are placed on the left side of the distribution of stock index returns. The normality assumption is overwhelmingly rejected with a p-value of the Jarque and Bera statistics less than 0.01. Ljung–Box portmanteau tests on squared return series at 20 lags indicate that there is heteroskedasticity.

Estimation result

In order to stress the importance of the jump processes in the analysis of the Nasdaq stock market volatility, this article estimates different marginal specifications as the simplest Garch, the constant intensity Jump-Garch and the ARJI-Garch models. We use the Maximum Likelihood Estimation (MLE) for all specifications. The number of jumps is 20, for all models.

Prior to discussing the parameter estimation results, the next section focuses on testing whether data exhibit constant intensity jump or time-varying conditional jump intensity.

Constant or time-varying jump? We divide the in-sample data into three subsamples; 2000–2004, 2005–2007, 2008–2010. We examine the constant jumps intensity model over the different sample periods (Table 2). The coefficients λ are at a whole statistically significantly different from 0 at the level of 5%. This implies that there exists jump behaviour for the Nasdaq returns. As discussed above the jump-Garch model supposes that the jump intensity parameter λ_t is constant, i.e., $\lambda_t = \lambda$ for all t. For the three periods, the jump intensity parameter respectively ranges from 6.533 (2000–2004) to 0.784 (2005–2007), and then, to 0.249 (2008–2010). Our findings provide evidence of changing jump dynamics over the subsamples. The parameters estimates of the mean of the jump size, θ, and the jump variability, δ, are all significant. The estimated value for $\theta(\delta)$ is -0.219 (0.343) in the first period and - 1.381 (-0.881) in the third period, respectively. This provides further evidence of time varying jump.

Table 2. Parameter estimates of the constant intensity jump model for different sample periods

Models estimation.

Various models are estimated to determine the 'best' risk model, i.e., AR(2) GARCH(1,1), the simplest constant intensity jump model namely Jump-GARCH(1,1) and the ARJI model namely ARJI-GARCH(1,1). For each model, we distinguish two conditional distributions as explained in the methodology.

Table 3 reports parameter estimates for these alternative models during the in-sample period. For each model, the first column represents the normal distribution and the other representing the GED distribution. The estimated results of the models all meet the conditions that each parameters (α, β), of the conditional variance equation, be greater than or equal to zero and sum to a value less than one to insure the stationarity of the covariance. As indicated in Table 3, the volatility persistence indicated by ($\alpha + \beta$) was more than 0.96, in each case. The estimated degrees of freedom parameter (shape parameter) of the GED distribution for residuals is less than two confirming that the log returns are not normaly distributed. The log-likelihood values confirm this finding.

Table 3. Parameter estimates of the Garch, constant jumps-Garch and the ARJI models

	GARCH		Jump-GARCH		ARJI	
Parameter	Normal	GED	Normal	GED	Normal	GED

Notes: [a]a, b and c denote significance at the 10%, 5% and 1% levels, respectively.
[b]Figures in parentheses ( ) indicate *t*-statistics of the estimated coefficients.

Regarding the jump parameters ζ_0, η_0 and λ_0, except for the jump volatility ζ_0 in the Jump-GARCH-GED model, all the other coefficients describing the dynamic characteristics of $\square_{\square,\square}$ are statistically significant at 1%. Especially, the mean of the jump size $\square_0$ is significantly negative in all models, which implies that after a stock market downturn, the direction of a jump in the next period is more likely to be positive than negative. The coefficient $\square_0$ in the Jump Garch model is highly significant, implying that there a jump behaviour for the Nasdaq return whenever there is abnormal information. Furthermore, as regards to the jump intensity ($\square_{\square}$) in the ARJI models, the coefficients ($\square_0$, ρ and γ) are also found to be significant, indicating the presence of time-varying jumps on the arrival of news events. Positive and significant values of ρ parameters (0.89 and 0.71) which measures the persistence in the conditional jump intensity, implies that a high probability of many (few) jumps today tends to be followed by a high probability of many (few) jumps tomorrow. γ parameters which measures the sensitivity of $\square_{\square}$ to the most recent intensity residual ($\square_{\square-1}$) are also positive (0.10 and 0.34), suggesting that a unit increase in $\square_{\square-1}$ results in a increased effect on the next period's jump intensity.

Our empirical results proved the need for dynamic jump processes. The log-likelihood values in Table 3 show that all jump models significantly improve on the fit of the GARCH models and that ARJI-GED model performs other Jump models. Moreover, the GED distribution performs better in the Garch and ARJI-Garch however in the Jump-Garch model the normal distribution performs better. We aim to look at the performance of jump models, to provide more insight into this models performance and finely, to determine 'optimal' risk models.

Var calculation and back-test. When assuming a normal distribution for the innovations, the VaR for long trading positions (i.e. left tail of the density distribution of returns) is given by Equation 21 with $\square(\square_{\square};\square)$ being the left quantile at c% for the standardized normal distribution. When assuming a skewed Student distribution, the VaR for long trading positions is given by Equation 22 with $\square(\square_{\square};\square,\square)$ being the left quantile at c% for the standardized GED with κ degrees.

After forecasting VaR of each day in the out-of-sample(1 June 2010-28 July 2011), using the procedure described above under 90%, 95% and 99% confidence-levels, the VaR given by the several models are now compared with real observations and then evaluate the performance of the constructed models using backtesting techniques. The results of mean VaR and failure rates are reported in Table 4. The failure rates compute for each VaR is defined as the number of times returns exceed (in absolute value) the forecasted VaR. If the VaR model is correctly specified, this rate must be equal to c. If this is not confirmed, the model is considered of poor predictive quality. If the failure rate is greater than the given probability c then the model underestimates the true risk. As shown in the Table 4, for low confidence-level (90%) and compared to models based on GED distribution, models based on normal distribution yield the highest VaR estimates, the lowest average failure rate and quadratic loss. However for the high confidence-level (99%), the estimated VaR produced by models based on GED distribution are higher than those based on normal distribution. We note here that for the higher confidence-level of 99%, the effect of fat tails becomes much acute. Based on the failure rates, most models tens to overestimate the true risk since the failure rates are smaller than the corresponding probabilities.

Table 4. Mean VaR and the faillure rates

	GARCH		Jump-GARCH		ARJI	
Parameter	Normal	GED	Normal	GED	Normal	GED
90% confidence-level	-2.7407	-2.7388	-3.2939	-1.1413	-2.7991	-1.2980
	(0.026)	(0.026)	(0.019)	(0.165)	(0.026)	(0.158)
95% confidence-level	-3.2606	-3.3337	-3.8171	-2.1138	-3.3195	-2.2734
	(0.016)	(0.016)	(0.016)	(0.056)	(0.019)	(0.049)
99% confidence-level	-4.2835	-4.5545	-4.2856	-6.2581	-4.3432	-6.4304

	(0.009)	(0.006)	(0.013)	(0.003)	(0.013)	(0.003)

Note: failure rates (in the parentheses)

Basically two test procedures to examine the performances of the VaR forecasts: Unconditional and Conditional. The results for the LR test of Kupiec (1995) are reported in the first part of Table 5.

Table 5. Unconditional and Conditional coverage tests of VaR models

Unconditional coverage tests

	GARCH		Jump-GARCH		ARJI	
Parameter	Normal	GED	Normal	GED	Normal	GED
90% confidence-level	+	+	*	*	+	*
	x	x	x	x	x	x
95% confidence-level	*	*	*	+	*	+
	x	x	x	0	x	0
99% confidence-level	*	*	*	*	*	*
	x	x	x	x	x	X
Conditional coverage test						
90% confidence-level	*	*	*	*	*	*
	x	X	x	x	x	X
95% confidence-level	*	*	*	*	*	*
	x	X	x	x	x	X
99% confidence-level	x	X	x	x	x	X
	*	*	*	*	*	*

Notes:
[a]The symbol '0', 'x' is used to denote VaR models which pass (fail to pass) the unconditional coverage test for the respective market at the 5% significance level.
[b]The symbol '+', '*' indicates that the null hypothesis was rejected (accepted) at the 10% significance level for the LR_{uc}
[c]LR_{uc} statistics under 90%, 95% and 99% confidence-levels.
[d]The LR_{uc} statistics are asymptotically distributed $\chi^2(1)$.

Results show that for low confidence-level (90%), the GARCH model and the ARJI based on normal distribution pass the □□□□ test. However for the high confidence-level (99%) all models fail to pass the □□□□. Moreover, results suggest that the best performing VaR models for 5% significant level are the Jump-Garch-GED and the ARJI-GED.

Results of Christoffersen's likelihood ratio test suggested that all models failure to pass the conditional coverage tests.

Conclusion

In parametric VaR estimation, volatility is one critical important factor. This article attempts to improve VaR estimation by investigating the influence of jump dynamics on stock market volatility. To this end two conditional independent processes, i.e., a diffusion and a compounded Poisson process, describe the volatility behaviour of stock returns. Heavy tails are modelled using GED distribution. We compare the VaR forecasting performance of ARJI, Jump-GARCH and GARCH models based on the unconditional and conditional tests. Daily Nasdaq stock index is used for empirical investigation.

Interesting results are observed. First, strong evidence of Jump dynamics in the Nasdaq return whenever there is abnormal information were provided. Second, Jump Garch and ARJI models are found to perform well compared to GARCH models. Third, the effect of fat tails becomes much stronger at high confidence-level (99%) hence a GED distribution is more suitable. Finally, based on Christoffersen's conditional coverage tests, models tens to overestimate the true risk.

Abstract

The Malaysian government has always encouraged researchers of institutions of higher learning to commercialize their research and development product. Huge funding and scheme has been allocated to promote and encourage university researchers to conduct a research and produce innovative product that are able to be commercialize. However, the report from Malaysian Ministry of Higher Education (MOHE) highlighted the performance of commercialization of university research and development products under satisfaction. Hence, this has indicated that there is a necessity to address the circumstances and drive the universities to a better performance. This paper explores and identifies factors that might have a relationship with the ability of researchers to commercialize their research and development product. The data was collected through survey questionnaire because it allowed the identification of important and emerging issues that required further explanation. The useable response rate was 200 and the data analyzed to explore the relationship between variables. The result indicates that both Entrepreneurial Orientation (EO) and Market Orientation (MO) has influence the commercialization of university research and development product.

Keywords: Entrepreneurial Orientation (EO), Market Orientation (MO), Commercialization, Research and Development

Introduction

Malaysian government targeted to be a higher income nation in the year 2020. Therefore numbers of agendas and activities had been plan and execute for achieving the aim. Research and development are one of the main agenda that has been focus on whereby RM 285 million invested in Ninth (9^{th}) Malaysia Plan (2006-2010). For the Tenth (10^{th}) Malaysia Plan (2011-2015), the budget allocation increased to RM741 million and portray the seriousness of Malaysian government toward research and development. The current report by MOHE (2014) stated that the commercialization rate is still low with a total of 125 products commercialize from 2059 created.

According to Pries and Guild (2004) research and development activities are able to lead to the commercialization of research products and contribute to the economic growth of the nation. Developed countries such as United States (US) and Canada are able to generate more than 1 (one) billion annually from the commercialization activities between 1980 to 2010 with more than 5,000 new innovation.

Research and development are normally associated with universities or institutions of higher learning due to their ability as a hub to the distribution, creation and application of a new knowledge. Research and

development are used and tested actively to create an innovation in which successfully commercialized will becoming source of income generation for the university.

Although universities main function is providing teaching and learning as well as conducting research, however they are expected to commercialize their research and development product. This indicates that, the researchers are requiring studying the marketing potential of the research product before they are embarking into the research. It will beneficial and valuable to the money invested by university.

Research Objectives

The objectives of the research are as the following:

a) To investigate whether Entrepreneurial Orientation (EO) have an influence toward commercialization of university research and development product.

b) To explore whether Market Orientation (MO) have an influence toward commercialization of university research and development product.

c) To identify the most contributing factor toward commercialization of university research and development product

Furthermore based on the research objectives two related hypotheses were also developed in this study, which are:

H1: there is a positive relationship between entrepreneurial orientation (EO) and commercialization of university research and development product.

H2: there is a positive relationship between market orientation (MO and commercialization of university research and development product.

Both hypotheses aim to test the relationship between constructs developed in this research.

Research Framework

Figure 1 shows the framework of the research which is inclusive of independent variables (IV) and dependent variables (DV). The two (2) independent variables identified in this research are Entrepreneurial Orientation (EO) and Market Orientation (MO). Entrepreneurial Orientation (EO) consist of innovativeness, risk taking and pro-activeness are classified as independent variables (IV). The other independent variables is Marketing Orientation (MO) with consists of customer orientation, competitor orientation and inter-functional coordination. Meanwhile the dependent for this framework variable is commercialization of research and development product.

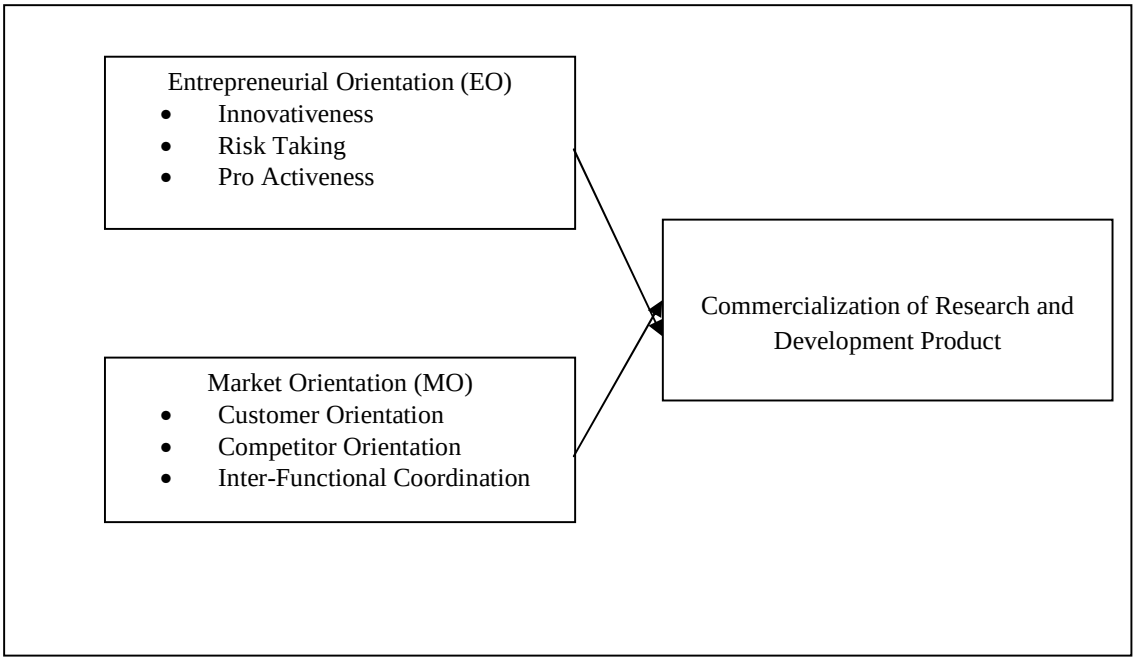

Figure 1: Research Framework

Literature Review

Entrepreneurial Orientation (EO)

Historically, EO has been conceptualized as comprising three dimensions as reiterated by Miller (1983) and these are innovativeness, risk taking and pro-activeness. Innovativeness is the predisposition to engage in creativity and experimentation through the introduction of new products/services as well as technological leadership via research and development in new processes. Lumpkin and Dess (1996) were among the first who emphasize the role of innovation in the entrepreneurial process. Innovativeness has become an important factor used to characterize entrepreneurship and to reflect a firm's tendency to engage in and support new ideas, novelty, experimentation, and creative processes that may result in new products, services, or technological processes. Risk taking involves taking bold actions by venturing into the unknown, borrowing heavily, and/or committing significant resources to venture in uncertain environment (Miller, 1983). Risk taking has been viewed as a fundamental element of entrepreneurship (Antoncic and Hisrch, 2003). According to Swierczek and Ha, (2003) risk taking is a quality that is frequently used to describe entrepreneurship and the degree to which managers are willing to make large and risky resource commitment, which have a reasonable chance of costly failure. Pro-activeness is an opportunity-seeking, forward-looking perspective characterized by the introduction of new products and services ahead of the competition and acting in anticipation of future demand. Pro-activeness described by Lumpkin and Dess (1996) as "taking initiatives and pursuing new opportunities related to future demand and by participating in emerging market". It also refers to the extent to which a firm is a leader or a follower and is associated with aggressive posturing relative to competitors (Fairoz, Hirobumi and Tanaka, 2010). They claim that pro activeness reflects a firm's reaction to opportunities in the market place whereas competitive aggressiveness refers to firm's response to competitor's challenges. Even though Lumpkin and Dess (1996) suggested these two further dimensions, unfortunately some researchers are arguing that competitive aggressiveness and pro-activeness is similar in terms of definitions (Miller, 1983, Swierczek and Ha, 2003) and they still stress that innovativeness, risk taking and pro activeness are the key features of EO.

Meanwhile, for this research, the researchers will adopt an approach based on Miller's original conceptualization because the three dimensions (innovativeness, risk taking and pro-activeness) are the main traits of EO. This is due to the facts that the three (3) dimensions have been widely recognize by many researchers in the area of entrepreneurship as the main dimension for EO.

The role of EO towards business performance is widely acknowledged in the literature. Some of the researchers agreed that high performing firm require strong and established EO (Zahra, 2008; Wiklund and Shepard 2003). EO has also been relates to key organizational outcomes such as innovativeness, strategic flexibility and firm performance (Wiklund, 1999). Although there are many study conducted about EO and firm performance, however, no study focus on the relationship between EO and performance of commercialization university research and development products. Thus, this study intends to investigate the relationship between EO and the said variables.

Market Orientation (MO)

Market orientation (MO) has been defined in difference ways by many researchers in the literature. However majority of them are focuses MO as obtaining customer information, competitors, market factors, inter-functional assessment, shared diagnosis and coordinated action (Narver and Slater, 1994). According to Jaworski and Kohli (1993), MO is an organizational process that involves market intelligence generation, dissemination and responsiveness to such intelligence across department. Both definitions lead to core capabilities, competitive advantage, and business performance of an organization. It is important to be familiar with the market and to study the information about competition, customers, demand and production possibilities because it will be useful for creative ideas generation (Buchanan and Vanberg, 1991). Majority researchers have begun to understand about market orientation as they are able to gather relevant information and transform the knowledge into product development.

Many authors agreed that customers' needs and want are keep changing from time to time. Researchers therefore should continuously determining customers' needs and wants as it will help to generate the new dimension of required product in the market. It is an added advantage to the researchers if they are able to foresee the needs of the consumer in the future. This is to ensure the product will be survived in the market for a longer period.

On the other hand, Buchanan and Vanberg, (1991) stated that MO is positively related to business performance in all types of markets. This is agreed upon by majority of the authors such as Affendy, Asmat, Talib and Abdul Rahim (2011) well as Asikhia,(2011). Conceptually, there is a strong consensus among the researchers about the fact that the final result of MO will improve an organization performance.

Customer Orientation

Customer orientation will continuously understand the needs of the current customers and potential target customers. It is also contributed to superior financial performance when the organization satisfies their customers' needs and wants. This motivates customers continually engage with the organization. Zhang and Bruning (2007) indicate that customer orientation has a positive influence on firm innovation and performance.

Competitor Orientation

Competitor orientation is the constant understanding of the capabilities and strategies of the current and future competitors that use the knowledge in creating superior customer value (Asikhia, 2011). It's not only to understand the ability and strategies of the competitors, but also measuring themselves as compared to the target competitor strengths and weaknesses.. From the previous researches, it shows that competitor orientation is vital towards commercialization of university research and development products since it may create a competitive advantage for a new start-up created by university commercialization activity. Perhaps, understanding ability of current and future competitor and identifying their own strengths and

weaknesses will be the best strategies for university researcher to enhance the commercialization rate of university research products (Vorhies and Morgan, 2005; Zhang and Bruning, 2007*)*.

Inter-functional Coordination

According to (Narver and Slater, 1994) inter-functional coordination is the coordination of all functions in the business that utilizes customer and other market information to create superior value for customers. Organizations with better inter-functional coordination would have better ability to create, retain, and transfer knowledge within the firm. Better inter-functional coordination allows the firm to use knowledge about the customers and competitors more effectively (Zhang and Bruning, 2007). This study sees that inter-functional coordination plays an important factor in successful commercializing of university research and development products because researchers are able to share expertise, knowledge and experiences via inter or intra faculty within the university.

Commercialization of University Research Product

There is no consensus among researchers in the literature with regards to commercialization definition. Joly (2012) define commercialization as a process of extracting economic value from new products, processes, and knowledge through the use of Intellectual Property (IP) rights, licensing agreements, and the creation of spin-off companies. According to Zhao (2004) commercialization is a process of developing new ideas and/or research output into commercial products or services and putting them on the market. Developing country such as Malaysia is still left behind in terms of research capabilities as compare to developed country. In fact, Malaysia has just emphasized on commercialization of research product very recently. Malaysia government focus on research and development activities among the universities in stages started with the establishment of a research culture (2006-2008). This was followed by emphasizing on quality of research (2008-2010) and promoting research excellence through producing innovation and its commercialization in 2011 and 2012 (Aziz, Harris and Norhashim, 2011).

Methodology

Sampling Technique, Sample Size and Data Collection

This study employed a survey questionnaire as the primary data collection technique. According to Ghauri and Grønhaug (2002), the survey is an effective tool for obtaining opinions, attitudes and descriptions as well as for identifying cause and effect relationships. Data was gathered through a personally administered questionnaire and a total of 200 researchers responded. The respondents for this study were researchers from five (5) Malaysia Public Research University. The researchers from the said universities were chosen because being a research university they are expected to conduct more research and produce innovative product that are able to be commercialized. The researchers adopted the non-probability sampling technique through convenience sampling and the information collected was from members of the population who are available to provide it. This method is considered appropriate for the research due to the researcher's accessibility to the program attended by the respondents from the public university such as exhibitions, seminars and conferences. The data also gathered through personal networking.

Goodness of Measures for Instrumentation

The instrument used in the research is able to accurately measure the concept and variables that researchers intend to measure (Sekaran, 2011; Saunder et. al.,2009). This will help to ensure the quality of the study. The questionnaire used a five (5) point Likert scale for each item constructed. Both validity and reliability was used to measure the goodness of the data. Validity was tested through content and face validity to provide a better understanding of the questionnaire. Pilot testing was conducted on 30 respondents prior to the full distribution of the questionnaire. Corrective action was taken from the feedback given of the pilot study. On the other hand the reliability measures the stability and consistency of instruments and helps to assess the goodness of measures. There are a few ways of measuring the

reliability of the instrument and the most widely used test is Cronbach's Coefficient Alpha (Hussey and Hussey, 1997; Zikmund, 1997; Bryman and Bell 2003). Table 1 shows Cronbach's Alpha values of construct for the instruments of this research.

Table 1: Reliability results for the constructs variables no of items Cronbach's Alpha

Variables	No of Items	Cronbach's Alpha
Entrepreneurial Orientation (EO)	18	0.86
Marketing Orientation (MO)	19	0.89
Overall	62	0.91

The data tabulated in Table 1 shows that the Cronbach's Alpha values range from 0.86 to 0.91, thus confirming the reliability of the instrument. The higher the coefficient, the better the measuring instrument.

Profile of Respondents Table 2 shows the frequency and percentages of distribution of the respondent profiles. A majority of the respondents were female with56% compared to 44% males. Majority of the respondents were less than 40 years old (62.5%), 41 – 60 years old made up 26% and followed by the more than 60 years old age group (1.5%). In term of qualification, 54.5% of the respondents possess Doctor of Philosophy (PhD) and 45.5% Master's degree. Most of the respondents (70%) had less than 10 years of length of service. 28.5% between 11 – 20 years and only 1.5% more than 20 years of service. In the case of commercialization, only 35.5% of the respondents able to commercialize their products, 23% in the process and 45.5% had no experience at all.

The objective of this study is to identify the relationship between entrepreneurial orientation (EO) and market orientation (MO) on commercialization of university research product. In order to achieve this objective, the study employed a bivariate statistical analysis. The results shown in Table 3 indicates that there is a significant positive relationship between entrepreneurial orientation (EO) and commercialization where $r = 0.306^{**}$, $p<0.05$. Similarly, the results also indicate that market orientation has significant negative relationship with commercialization whereby $r = 0.265^{**}$, $p<0.05$.

Table 2: Demographic analysis

Item		Frequency	Percentage	Item		Frequency	Percentage
Gender	Male	88	44%	Length of Service	0-5 years	79	39.5%
	Female	112	56%		6-10 years	61	30.5%
Age	25-30 years	47	23.5%		11-15 years	35	17.5%
	31-40 years	78	39.0%		16-20 years	22	11.0%
	41-50 years	52	26.0%		More than 20	3	1.5%

					years		
	51-60 years	20	10.0%	Commercialization experience	Yes	63	31.5%
	Above 60 years	3	1.5%		No	91	45.5%
Qualification	PhD	109	54.5%		In the Process	46	23.0%
	Masters	91	45.5%				

Table 3: Pearson Correlations between constructs variables and commercialization

Construct Variables	Commercialization	
	Pearson Correlation (r)	Significant
Entrepreneurial Orientation	0.306**	0.000
Market Orientation	0.265**	0.000

*p<0.05

The two hypotheses were tested using multiple regressions in which no multicollinearity existed between the construct variables. This is shown in Table 4 through the results of the Variance Inflation Factor (VIF) and Tolerance level. Results for both constructs are within the acceptable level (VIF<10, Tolerance>0.1). The value of R^2 is 0.46 indicating that 46% of the variance in commercialization of university product can be explained by entrepreneurial orientation (EO) and market orientation (MO).

According to (Chin, 1998) the R^2 values of 0.67, 0.30 and 0.19 for dependent variables are described as substantial, moderate and weak respectively. Therefore in this study, the R^2 value of dependent variables (i.e., commercialization) is explained by the two predictive constructs which is 46%, within a substantial level. Furthermore, the results in Table 4 also show that entrepreneurial orientation (EO) is significant and positive related to commercialization of university research product and development with beta values β = 2.38, t-value = 3.284, p<0.05. Therefore, hypothesis (H1) of the study is accepted. Similarly, the results of market orientation (MO) indicates that there is significant and positive relationship with commercialization of university research product and development (β = 1.72, t value = 2.373, p<0.05). Thus, hypothesis H2 of the study is accepted as well.

Table 4: Hypothesis Testing Results

Hypothesis	β-coefficient	t value	Significant
H1	2.38	3.284	0.001
H2	1.72	2.373	0.019
Notes: R^2 = 0.46, F = 13.25, VIF (Entrepreneurial Orientation = 1.179, Tolerance =0.8487; VIF Market Orientation = 1.179, Tolerance=0.848)			

P<0.05

Conclusion

This study presents the influence of entrepreneurial orientation (EO) and market orientation (MO) towards commercialization of university research and development product. The results indicate that both independent variables (EO and MO) have a significant and positive relationship with dependent variable (commercialization of university research and development product). This implies that both the EO and MO are importance for researchers to commercialize their products. Although the researchers claim that the disciplines and working environment are not allow for them to think about commercialization of the product produce, it doesn't mean that they should totally ignore the important of EO and MO. This will narrow the gap between industries need and product produce. Therefore in order to ensure research and development products are able to be commercialized, the researchers should understand internalize and implement both EO and MO to ensure product produce is marketable and meet customer expectation. It is hoped that the findings of this study will be beneficial to the researchers and universities in the formulation of strategies and policies to increase the number of product to be commercialized in the future.

Acknowledgement

The researchers would like to take this opportunity to thank the Ministry of Higher Education (MOHE) for awarding the Fundamental Research Grant Scheme (FRGS) and Research Management Institute (RMI) Universiti Teknologi MARA, Malaysia for the assistance and support of completing this research.

Abstract

Aquaculture has an enormous contribution to worldwide food production, being one of the fastest growing food sectors and a significant economic activity for many countries. In 2012, aquaculture contributed with 42.2% to total fish production. Due to the continuous growing of world population and of rising incomes and urbanization, aquaculture will continue this impressive development, being expected to overcome capture fisheries production till 2030. The continued growth of aquaculture contributes to increasing pressure on natural resources, water, feed and energy. Fish production generates considerable amounts of effluent which may have an adverse environmental impact. Generally, aquaculture effluents include uneaten feed, faeces and other organic and inorganic compounds. Because aquaculture depends largely upon a good aquatic environment, mainly the success of developing aquaculture needs to be related to it. In the context of the aquaculture expansion it is essential that the aquaculture technologies be ecologically sustainable and to respect environmental legislation. Mostly, the impact of aquaculture on environment mainly depends on reared fish species, rearing and management techniques, location and also, local environmental conditions. In this context, the aim of this present paper is to present a literature investigation regarding the world aquaculture status, together with its potential effects on the environment.

Keywords: environmental impact, sustainable aquaculture, aquaculture production systems.

Introduction

Fish is considered a food with a high nutritional value, providing an important source of protein and a wide variety of vitamins (such as D and B2-riboflavin), minerals (iron, zinc, iodine, magnesium, and potassium) and poly-unsaturated omega-3 fatty acids. According to the report of Food and Agriculture Organization from 2014, in the year 2010 fish accounted 16.7% of the global population's intake of animal protein and 6.5% of all protein consumed. Taking into consideration that world's population keeps growing during next decades and global life standards, respectively animal protein need rises, fish demand will certainly growth. Because the wild fish captures are already exploited at maximum level, a large part of those new demands must be satisfied through aquaculture activity. As a result, aquaculture has generated a great interest from the international scientific community, supplying the concerns regarding the increase of sustainability and profitability by different methods.

Aquaculture represents the farming of aquatic organisms including fish, mollusks, crustaceans and aquatic plants. According to the Food and Agriculture Organizations, 2014, aquaculture is the fastest growing animal food sector in the world. Food and Agriculture Organizations, (2000) mentioned that

in the present, aquaculture supplies an estimated 49% of all fish that is consumed by humans globally and is expected to contribute to more than half of the global fish consumption till 2030.

Although aquaculture has many benefits (providing food and ensuring jobs for humans) a big concern which is facing it is represented by its environmental impact and water quality degradation. Acoording to Guangjun et al (2010), if this sector is not well managed we may experience some unreasonable phenomena such as: the random discharge of aquaculture wastewater, the abuse of medicines, and the escaping of aquatic animals, which have serious influences on the environment.

A. The state of World and EU Aquaculture. World food fish aquaculture production expanded at an average annual rate of 6.2% in the period 2000–2012, slower than in the periods 1980–1990 (10.8%) and 1990–2000 (9.5%). Between 1980 and 2012, world aquaculture production registered a slight increase with an average rate of 8.6 % per year. In a report published by Food and Agriculture Organizations (2014), in the year 2012, this sector reported a record registering almost 90.4 million tonnes, including 66.6 million tonnes of food fish and 23.8 million tonnes of aquatic algae, being estimated for 2013 a production of 70.5 million and 26.1 million tonnes, respectively. The World per capita apparent fish consumption increased from an average of 9.9 kg in the 1960s to 17.0 kg in the 2000s and 18.9 kg in 2010, with preliminary estimates for 2012 pointing towards further growth to 19.2 kg (Food and Agriculture Organizations, 2014).

The species that dominate world aquaculture are aquatic plants, shellfish, herbivorous fish and omnivorous fish. Also, a rapid increase is obvious for marine aquaculture of carnivorous species, especially salmon and shrimp and other marine finfish (Food and Agriculture Organizations, 2014). The most widespread type of aquaculture in the world is represented by the farming of tilapias, Pangasius and other cichlid species. (Food and Agriculture Organizations, 2014).

The global distribution of aquaculture production in all regions and countries with different levels of economic development remains unbalanced. Asia dominates this production, accounting 88.39% of world aquaculture production in 2012, this being determined by the significant contribution of China (Food and Agriculture Organizations, 2014).

Compared to world aquaculture production, which continues to rise, European aquaculture is in a period of stagnation. EU contributions to world aquaculture production have been decreasing significantly over time in both volume and value terms, representing only 1.9% and 3.5% of world production in 2012. According to Eurostat 2014, aquaculture production by the European Union Member States was approximately 1.25 million tonnes of live weight in 2012, almost the same as in 2011. This represented a decline in aquaculture production of about 11% after the relative peak of 2000.

Mainly, the most valuable species produces in EU are Atlantic salmon, oysters, sea bream, sea bass and trout. The main species produced in freshwater is represented by trout. Also, carp is another important species mostly produced in Eastern Europe, where the main producer is Poland covering 39% in terms of total value (Food and Agriculture Organizations, 2014). According to Eurostat (2014) the three largest aquaculture producers among the EU Member States were Spain, the United Kingdom, and France, which together accounted for more than half (54%) of the EU aquaculture production in 2012.

Aquaculture production systems. Aquaculture systems can be classified in extensive, semi-intensive, intensive, or highly or super intensive depending upon the number of organisms grown per volume of water and the water source and supply. Extensive aquaculture is practiced without feed or fertilizer inputs. In semi-intensive aquaculture fertilizers can be added to increase the natural productivity and the water quality can be improved using additional aeration. In intensive aquaculture high densities are practiced using aeration, full feed, and chemical supplements, in order to promote the health of the organisms grown. In principal, freshwater aquaculture is practiced either in fish ponds, pens, cages or, on a limited scale, in rice paddies, in high flow-through tanks or in recirculating aquaculture systems (RAS), brackish aquaculture is done mainly in fish ponds located in coastal areas and marine culture employs either fish cages or substrates for mollusks and seaweeds such as stakes, ropes, and rafts (Food and Agriculture Organizations, Aquaculture Systems and Practices: a Selected Review,

1989).

Pond aquaculture. Pond aquaculture represented the oldest fish farming activity and involves maintaining the environmental conditions at the same level of the technological requirements of fishes. In these systems fish are raised at low densities, mainly because of lack of additional feeding, fish feeding on aquatic animals reared is strictly resulting from natural productivity and due to the difficulty to control water quality. Usually, in order to improve natural food are applied organic and inorganic fertilizers, which contribute to developing natural developing micro and macro flora, food that will support fish populations or other aquatic animals. Higher production can be obtained in the condition of supplementary feeding and higher stocking densities, but this supposes water aeration. According to SRAC (Southern Regional Aquaculture Center), Publication No. 163/1997, in a pond without aeration, it can be obtained from 226 kg to 680 kg of fish per 0.40 ha. Instead, in a pond with aeration, it can be obtained around 1133 kg to 1814 kg of fish per 0.40 ha. To increase the profitability of these systems is indicated to combine both fertilizer and supplementary feeding.

Between the main disadvantages of these systems, we emphasize: require large volumes of water, large land/pond area, due to the use of organic and inorganic fertilizers may appear eutrophication of the waters, incapacity to guarantee the safety of the product to consumer, because ponds systems are open-air there is always a risk of water contamination. But, according to Verdegem & Bosma (2009) if this systems succeed a better optimization of water consumption and feed management they could triple production without increasing freshwater usage. That's why, to increase the economic efficiency of this systems it`s crucial to optimize water consumption, a good solution being the integration into other production systems and also applying of a production management focused on sustainability.

Aquaculture in Raceway. Raceway, also known as a flow-through system, represents enclosed systems which are based on the continuous water flowing through the culture tanks. Because in these systems water enters at one end and flows through the raceway in a plug flow manner, the best water quality exist only at the head of the tank, where the water enters, and then deteriorates along the axis of the raceway toward the outlet (Timmons and Ebeling, 2013). In comparison with the ponds these systems have several advantages, as higher stocking densities, improved water quality, feeding and harvesting are done more easily, less off flavor and an easier way to control disease problems. Fish metabolites are carried out with the effluent while settleable particulate wastes can be collected by settling or less frequently by other means of filtration. Optionally, this type of systems can be integrated into agricultural production, a fraction of the waste process water used in the irrigation of different agricultural areas.

Between the main environmental concerns of these systems we mention eutrophication as the main consequence of increased nutrient loadings (faecal and uneaten food waste), the use of chemicals to control parasites and disease. Also, a big disadvantage of raceways is related to the needs of constant flows of water with a high quality.

Cages and Pens. Cages are boxes shaped enclosure which floats, is suspended, or sits on the bottom of a larger water body. Usually, the cages size varied from 1.0 m^3 to 1,000 m^3. Usually, pens are much larger and serve as enclosures to hold organism for grown. In pens, organisms have free access to the bottom within the enclosed area. Growing and production of farmed aquatic organisms in caged enclosures has been a relatively recent aquaculture innovation. Primarily, these systems have been associated with the culture of salmonids, but due to the rapid expansion of aquaculture in the last 20 years this sector has grown very rapidly. Generally, cage culture is suitable for the growing of carnivorous species with a high economic value (Atlantic salmon, Coho salmon and Chinook salmon Japanese amberjack, red seabream, yellow croaker, European seabass, gilthead seabream, cobia, rainbow trout, Mandarin fish) (Tacon A. et al 2007).

The main advantages of cage culture are associated with the use of existing water and the fact that doesn`t require land ownership, the related capital costs being quite low making this technology the most economical culture. Also, a big advantage it`s represented by the possibility to move into optimal rearing environments and sheltered areas.

Between the disadvantages of the system, we mention the fact that these systems are permanently

exposed to foul weather conditions making impossible the controlling of physical-chemical water and also the environmental impact on water quality generated by these systems. Also, according to Sugiura et al (2000) and Tacon A. et al (2007), cage cultures are vulnerable to poaching and vandalism and to higher risks of fish escaping.

Aquaculture in recirculating systems (RAS). Recirculating Aquaculture Systems are used for fish farming or other aquatic organisms by reusing the water in the production by mechanical, biological chemical filtration sterilization, oxygenation, and other treatment steps. That's why RAS systems represent an alternative to pond aquaculture due to low water consumption (Verdegem et al 2006) better opportunities for waste management and recycling of nutrients (Piedrahita, 2003) and due to the easy way to control the spread of disease (Summerfelt et al 2009; Tal et al 2009). RAS are intensive production systems than most other types of traditional aquaculture systems (Timmons and Ebeling, 2013) and are the most compatible with environmental sustainability (Martins et al 2010), due to the production of small quantities of wastes and of water reuse. However, the main disadvantages of these systems are high capital and operational costs and requirements for very careful operational management. That's why this type of systems are justified only for growing high-value species such as sturgeon, pike, perch, eel, catfish, tilapia, etc.

B. Impacts of aquaculture on the environment. Due to rapid expansion and to continued pressure on natural water resources, energy and feed, aquaculture can produce different impacts on the environment. Aquaculture can exert both positive impact and negative on the environment. Usually, the quality and quantity of waste from aquaculture, as well as the environmental impacts of aquaculture, vary with farmed species, the management practices used and location of the production system but also on feed quality and management (feed composition, feed ration and feeding method) (Preston et al 1997; Wang et al 2005; Podemski C.L. and Blanchfield P.J. 2006). Among the major effects of aquaculture on the environment in this paper we refer to:

- Effluent discharges;
- Effects of other discharges from aquaculture (e.g. fertilizers, chemicals, and medicines);
- Escapes from fish farms and potential effects on wild populations.

Effluent discharges. Aquaculture effluents contain dissolved and suspended solids that have biochemical oxygen demand (BOD), ammonia and nutrients phosphorus (P) and nitrogen (N) that are derived from fish excretion, faeces, and uneaten feed, and specific organic or inorganic compounds (i.e. therapeutics). Between all these components a special attention is directed towards nitrogen and phosphorus which are considered the main pollutants of intensive aquaculture (Hakanson et al., 1998). These components are a real source of pollution and if they are developed at high level can cause of eutrophication (González et al 2008), resulting in occurrence of the harmful algal blooms (Pearl H. W. 1997; Goldburg Rebeca and Tracy Triplett et al 1997) and the depletion of oxygen due to the increase of microbial activities (Diaz et al 2008).

It is obviously that feeding is the main source of waste output from aquaculture, due to the high amounts in fishmeal (FM) which is rich in P. In fact, Ackefors, (1999) said that the content of phosphorus and nitrogen in the feed and the feed conversion rates are most important in assessing environmental impacts of aquaculture. According to Jackson et al (2003) and Schneider et al (2005) only 20% to the cultured organism is retained as biomass while the rest is incorporated into the water column or sediment. Moreover, Pierhadrita, (2003) says that nitrogen and phosphorus retention range between 10-49% and 17-40% respectively, while from faeces N and P are released from 3.6% to 35% and 15% to 70% respectively. Lastly, dissolved N and P excretions range from 37% to 70% respectively. Nowadays, modern aquaculture is based mostly on the feeding of manufactured feeds (extruded pellets) reducing the phosphorus excretion. For example, in a diet for salmon, with 40% protein, 30% lipids, 13% carbohydrate and a energy content of 19.2 MJ kg-1, the nitrogen content is around 7%, aspect which makes possible to use fat for energy (instead of protein) and excreted of smaller volumes of nitrogen compounds (Pillay, 2004). That`s why it is very important to know the ingredients from the feeds and to balance these nutrient in order to improve the nutritional quality. Cho et al (1991), says that the goal of aquaculture is to produce feed very well suited to the nutritional needs of the fish so that the maximum growth can be achieved with minimum waste, particularly phosphorus and nitrogen. So, according to Youssouf A. et al (2012), a way to reduce P waste produced by aquaculture is to replace the FM with FM substitutes that contain lower P, without

affecting the growth performance of fish. Also, Ayoola A. (2010) suggest that a possible alternative of protein sources, can be represented by animal proteins from rendering or slaughter, plant protein concentrates and novel proteins such as algae, yeast, dried distillers grains with soluble (DDGS) and insect meal.

Besides feed composition, others factor responsible for pollution effluent from aquaculture is the type of the culture systems and the practiced stocking densities. In general, the effluent resulting from aquaculture raceway is more polluted in comparison with ponds effluent, cages and pens, mainly because water passes quickly through raceways and dissolved and suspended matter are flushed out. Generally, wastes emitted from cages and raceways are quickly diluted but also can generate changes in sediment structure and function (Beveridge M. et al., 1997). On the other hand effluent from RAS systems, it is around 10% (daily water exchange) of total system volume per day, but RAS produce a concentrated waste.

Another important issue which will receive increasing attention is the practice stocking densities. High stocking densities suppose the concentration of many organisms in a low water volume, increasing the waste productions and thus increasing the concentration of phosphorus and nitrogen compounds from water. Also, not all fish species have similar metabolism having different capacities to process energy and nutrients, and that`s why choosing the suitable species for growth and the suitably grown system can be a good solution to protect the environment. Also, Manoochehri et al (2010), mentioned as a measure to reduce nutrient wastes or to avoid or reduce any negative environmental impacts a careful monitoring and management of aquaculture effluents.

Effects of other discharges from aquaculture (e.g. fertilizers, chemicals, and medicines). Besides the wastes, aquaculture effluents may contain chemicals (fertilizers, disinfectants and chemotherapeutants pesticides, antibiotics). Usually, fertilizers are used in aquaculture ponds, in order to increase the primary productivity by stimulating the phytoplankton growth. For that, a very important aspect is to establish the needed doses. These doses may be determined only from the knowledge of the chemical composition of the water and the physical-chemical characteristics of its bottom. Generally, in aquaculture are used organic fertilizers or inorganic fertilizers, or a combination of both. Inorganic fertilizers are an inorganic compound which contains nitrogen, phosphorus, and potassium. However, fertilizers, whether they are artificial or organic, can cause serious problems if they contaminate water or are added in excess, contributing to the deterioration of water quality and implicit to discharged effluents.

According to Okomoda V. (2011), in modern aquaculture, especially in high stocking density aquaculture, to prevent diseases, eliminate harmful biota, disinfect and restrain polluted and damaged water, multiple chemicals and medicines are used. In the lasts years, the use of antibiotics has grown, even their use remains still controversial. Generally, the antibiotics are incorporated in fish pellets and due to uneaten feed go straight into water and bottom. Also, they can enter in water through faeces and by urine excretion. In fact, there are researchers who indicate the approximately 70-80% of the drug ends up in the environment (Samuelsen, Torsvik and Erik, 1992; Lalumera et al 2004). Mainly, in aquaculture antibiotics are used for therapeutic purposes and as prophylactic agents (Zheng et al 2012), the most frequent fish infections treated with antibiotics are skin ulcers, diarrhea and blood sepsis (Food and Agriculture Organizations, 2005).

Although their use is carefully indicated, there are cases when their discharge into the aquatic environment can lead to serious damages, due to the fact that they came in direct contact with water and soil. (Boxall 2004). These risks are associated with the direct toxic effects (on benthic micro and meiofauna, algae, plankton and other aquatic organisms) and more subtle effects including potential modification of bacterial communities (and the promotion of antibiotic-resistant organisms) (Marine Strategy Framework Directive, 2015). However, the use of antibiotics in aquaculture remains still difficult, because they must be administered directly into the water, and that's why should be taken into account a number of considerations such as environmental integrity, the safety of fish and the aquatic products intended for human consumption.

Escapes from fish farms and potential effects on wild populations represent another big issue of aquaculture, with detrimental effects on the environment. According to a report published by The

Scottish Association for Marine Science and Napier University Scottish Executive Central Research Unit in 2002, escapees from fish farms may interbreed with wild population resulting in losses of genetic variability, including loss of naturally selected adaptations, thus leading to reduced fitness and performance. Also, escaping of fish from farms can be responsible for the spreading diseases and others pathogens. It is necessary for a better understand the relationships between disease and both as a means of preventing environmental economically serious disease outbreaks and indirectly promoting the need for better environmental management (Pullin et al 1993). In cases of cages, pens or other systems which release the untreated effluent directly into the water the possibility of transmitting diseases to wild fish stocks is quite high. The main way of introducing diseases is the transfer of infected farmed juveniles to these systems, or through infected food equipment, and through water streams (Ruiz et al 2000, Murray et al 2005, Salama et al 2011).

Conclusions

Aquaculture represents the sector with an important economic activity being situated on top of the food production industry. Increasing customer demand for aquaculture products, together with increasing environmental and also, the costs associated with land and water will determinate the producers to develop their technological facilities or to implement new solutions in order to assure the practice of high stocking densities and to meet the market demands while taking into consideration environmental protection.

In order to protect the environment, aquaculture activities must be conducted sustainably, with minimal impact on the environment. In fact, the aquaculture industry is already working on this requirement, which in many countries has reached an impasse. In conclusion, to develop a sustainable growth of aquaculture is needed to be profitability, economic development and to practice a good waste management. There are many measures which can be taking in order to reduce the environmental impact of aquaculture, as: reducing as much as possible food losses, the adoption of management strategies of discharged effluents, like the utilization of the recirculating systems or systems with low or zero water exchange, the revalorization of the wastes by integrating in hydroponic systems for plants production or for composting for garden applications. Also, it is important to ensure sustainable sourcing of feed, to avoid escapes by adopting technical standards, to minimize biodiversity impacts and to reduce the impact of chemicals and medicine use, particularly antibiotics.

Une Politique de Tarification Routière : Le Péage Urbain en Tunisie ?

Amira Mabrouk, Laboratoire CODECI, FSEGS, Sfax.mabrouk.amira@gmail.com

Chokri Abdennadher, Professeur, université de Sfax, FSEGS, Chokri_abdennader@yahoo.fr

Abstract

Afin d'étudier une politique économique rationnelle et tarifier le prix d'un nouveau projet public, il est indispensable d'étudier les réactions des consommateurs face à un changement de prix ou de situation. L'objet de cet article est de montrer que le processus d'acceptabilité d'une mesure comme le péage urbain est une condition préalable nécessaire mais insuffisante. Complété par une étude empirique qui consiste à s'interroger sur la disposition à payer des automobilistes afin d'économiser la perte du temps inhérente aux déplacements quotidiens. Cette étude s'inscrit dans une perspective novatrice, puisqu'elle initie une étude sur la mise en place d'une nouvelle politique urbaine ; le péage urbain ; en Tunisie. L'objet de cet article est de (i) analyser l'impact d'une politique de gestion publique de la congestion via le biais d'un péage urbain sur les citadins, (ii) estimer le consentement à payer des automobilistes pour réduire la congestion urbaine et déterminer les variables favorisant cette disposition à payer. Pour atteindre ces objectifs, cette étude fait valoir une riche enquête de terrain menée dans la ville de Sfax. A l'aide de la méthode d'évaluation contingente, nous analysons les préférences déclarées de 457 automobilistes pour réduire la congestion et la perte du temps aux déplacements.
Keyword : consentement à payer, évaluation contingente, péage urbain.

1. Introduction

Synonymes de perte de temps, de stress et de frustration, se déplacer, pour se rendre au travail par exemple, est un geste routinier qui cause une gêne quotidienne et constitue par là même un réel symptôme de dysfonctionnement de la mobilité urbaine. Mais au-delà de cette subjectivité des termes, la prise en compte du temps en tant que ressource rare pose, elle, le problème crucial de sa valeur. Notamment, l'utilisation de l'automobile ne signifie point qu'un nouveau besoin spécifique de voiture particulière est né ; le besoin final est toujours le même. Ce qui existe c'est une demande de déplacement associé à une hausse continue du coût du temps, laquelle conduit un grand nombre d'usagers à rechercher des moyens de plus en plus rapide pour se déplacer. C'est précisément le cas de ceux dont les trajets s'éternisent et sont ralentis et/ou irrités par la congestion routière. Ce coût *psychologique* est cependant accentué par l'incapacité du réseau routier à contenir une demande de plus en plus accrue et constitue de ce fait un enjeu de politiques économiques majeur. Cela dit, outre le ralentissement et le manque de productivité inhérent, la congestion routière nuit à la qualité de l'air urbain, à l'environnement naturel, aux bâtiments et à la santé des individus. Les finances publiques sont les premiers sollicités pour assumer les dépenses d'infrastructures routières et de financement des transports collectifs. Toutefois, les difficultés budgétaires conjuguées à un problème de congestion routière vont amener davantage les autorités à faire payer aux usagers le prix de leurs présences sur le réseau. Dès lors, la question est de savoir s'il est possible de forcer les automobilistes à internaliser, via des péages urbains notamment, cet effet externe.

Le principe de ce péage renvoie aux travaux pionniers de DUPUIT (1844) et PIGOU (1920). Muni d'une théorie de l'utilité, DUPUIT part de la situation où une taxe *ad valorem* majore le prix d'un bien marchand, ce qui le conduit à étudier par analogie les effets d'un péage urbain sur la demande de déplacement. C'est dire que le péage urbain (*congestion princing*) permet, en fonction de son prix et son objectif, de modifier le comportement des automobilistes.

Un économiste *normatif* peut facilement justifier l'internalisation de l'externalité de congestion, le concept de bien public (bien-être collectif) étant le référentiel de base. Un économiste imprégné par une vision plus réaliste considère, en revanche, qu'il ne s'agit pas là d'une tâche facile et surtout ce n'est pas un *free lunch*. Une régulation par les prix, *i.e.* le péage urbain, est le résultat d'un processus politique contraint par des objectifs d'efficacité, d'équité et d'acceptabilité sociale mettant en scène

des groupes d'intérêt et des fonctions de préférences non congruentes. La conjecture est d'autant plus plausible que ces groupes d'intérêt sont également des contribuables qui perçoivent (sans surprise) le péage urbain comme une taxe supplémentaire. Cette méfiance est couplée d'une interrogation sur les conditions d'emploi et d'affectation des recettes collectées, l'idée de l'*État Léviathan* venant compléter le tableau. En somme, si la littérature économique relative à la congestion routière abonde, il n'en ressort aucun plaidoyer la *légitimant*. En revanche, elle suscite chez les économistes une interrogation sur la manière de réduire les effets externes négatifs qui y sont liés. C'est alors que le péage urbain apparaît comme une réponse à des problèmes de rareté qui se heurte au principe de gratuité.

Or, l'acceptabilité admet, on le sait, une dose d'inégalité pour conserver l'efficacité et/ou l'équité. C'est donc un compromis qui pâtit de l'hostilité des automobilistes (RAUX, SOUCHE, 2001).

Notre message théorique est précisément de s'interroger sur l'adhésion sociale du péage urbain à Sfax (deuxième grande ville de la Tunisie) et de s'interroger sur les politiques d'accompagnement à mettre en place par les pouvoirs publics. En somme, tout le pari d'une collectivité qui instrumentalise le péage urbain ne consiste pas uniquement à atteindre les objectifs visés en matière de mobilité interne ou d'environnement. Il s'agit en outre de faire accepter le péage par les usagers. La question de perception est ici cruciale. Une meilleure acceptabilité, voire l'appropriation de la mesure, en dépend. D'autres questions ayant trait à l'efficacité économique d'un tel instrument, aux comportements des automobilistes et à la nature de la circulation de la ville sont d'importance. Nous visons en premier lieu d'étudier l'acceptabilité d'un outil tarifaire dans la ville de Sfax à travers la méthode d'évaluation contingente et d'estimer par la suite la valeur du temps qui est la variable structurante dans le processus d'acceptabilité sociale.

Parallèlement, il s'agit est d'inscrire une politique des transports dans une logique de développement durable. Cela dit, le calcul des coûts de la congestion s'avère primordial pour le choix d'une nouvelle politique de lutte à la congestion. Ces coûts, comme la perte de temps et le gaspillage de carburant sont directement assumés par les conducteurs mais également assumés par l'ensemble de la société. Dans cette perspective, les décideurs publics se trouvent impuissants à contenir ces coûts représentés par les externalités environnementales négatifs et la perte de temps (perte de productivité).

2. Évaluation contingente de la congestion routière dans la ville de Sfax : enquête sur l'acceptabilité d'un péage urbain

L'automobile, on le sait, contribue aux changements climatiques causés par le rejet des émissions atmosphériques, lesquelles génèrent des externalités négatives. Une étude conduite en 2010 pour évaluer l'acuité des nuisances sonores à Sfax, montre que les pics de CO les plus importants sont observés dans le centre-ville et notamment durant les heures de pointes (le matin lors du déplacement domicile/travail et le soir par les sorties estivales entre 18h et 21h) enregistrant 20ppm. Quant aux pics de bruit cela dépasse les 95dB en fonction de la fréquence des déplacements à des heures et des zones bien déterminées. Cela dit, l'évolution du nombre de déplacement par jour par automobile n'a cessé d'augmenter passant de 660 000 en 1996 aux 1300 000 déplacements en 2012 (INS, 2014). L'intensification de la circulation caractérisent notamment le centre de la ville. En effet, la commune de Sfax et les 6 municipalités alentour, se sont constituées en un groupement intercommunal pour former le Grand Sfax qui compte 50 % de la population du gouvernorat de Sfax. En 2014, Sfax-ville compte 299000 habitants dont 2 339,00 possèdent une voiture sur une superficie de 27.09$\mathbf{km^2}$. La concentration des activités, couplée à l'augmentation des véhicules particuliers entrainent, sans surprise, des difficultés de circulation et un déficit de stationnement. Cette situation génère de la pollution, des difficultés de circulation et un stationnement anarchique. Les effets de la congestion à Sfax sont apparents durant toute la journée et ses causes sont complexes.

A ce niveau, nous proposons le péage urbain comme solution de double objectif mais qui concourt des difficultés de mise en place relatif à son acceptabilité sociale. Il est alors indispensable, de justifier notre étude par une analyse avantages-coûts. Cette dernière requiert l'estimation de la valeur de réduction de la congestion routière. Mais, puisque la route est un bien public (gratuit), le temps qu'on évalue est ressource rare, le recours à la méthode d'évaluation contingente s'avère indéniable notamment que nous présentons un scénario fictif (péage urbain). Cette dernière est basée sur la création d'un scénario hypothétique (mettre la zone à péage). Elle a été utilisée et appliquée,

selon les règles d'art d'échantillonnage, en considérant un échantillon de 457 automobilistes, pour une population composée de 2 339,00 individus possédant une voiture et parcourant Sfax-ville.

La motivation de notre étude trouve quant à elle ses sources en économie des transports. Elle valorise le temps des déplacements en estimant les variables influant l'utilité des voyageurs.

Dans cet exercice, il s'agit pour l'essentiel d'évaluer la disposition à payer des automobilistes face à un scénario hypothétique, *i.e.* la mise en place d'un péage urbain pour économiser le temps de déplacements journaliers, ce qui requiert l'utilisation de la méthode d'évaluation contingente, seule capable de répondre à notre objectif.

En faisant appelle à une méthode d'évaluation contingente, deux questions s'imposent. Celle relative à la formulation personnelle de la valeur du CAP, qui revient à un choix sous contrainte budgétaire. Une seconde, relative à la révélation de cette valeur, qui est une question de comportement stratégique.

D'un point de vue politique, les nombreuses externalités négatives que les voitures infligent à la société (congestion, polluants, accidents, bruits) justifient en effet des interventions correctrices minimisant les pertes de bien-être collectif (DE PALMA et ZAOUALI (2007), SMALL and VERHOEF (2007)) à travers un système de taxation urbaine.

3. Conclusion

Notre enquête nous a permis de recenser quelles étaient les principales questions qui intervenaient dans l'acceptabilité sociale d'une nouvelle mesure tarifaire, l'objectif de cette seconde partie était de construire un processus d'acceptabilité en avant-projet afin d'éviter l'échec du péage.

Sur la base d'une enquête de préférences déclarées, en réaction à des enquêtes officiellement menées en Europe et en Asie, nous avons construit un cadre d'analyse de l'acceptabilité tarifaire qui intègre en dynamique l'efficacité et les différentes dimensions théorique de l'équité de la nouvelle mesure (équité territoriale : garantie d'accessibilité ; équité horizontale : principe de l'usager-payeur, équité verticale : bien-être social).

Ce cadre a été validé d'abord qualitativement sur la base d'une enquête sur terrain auprès de 457 automobilistes parcourant le centre-ville de Sfax. Puis grâce au calcul du consentement à payer qui nous en avons recherché une validation quantitative. Il ressort de cette étude que parmi les 457 automobilistes enquêtés, 85 % ayant déclaré des difficultés de stationnement près de leurs lieux de travail et perdent au moyenne 10 minutes à tourner en rond pour trouver une place au centre-ville. Les automobilistes semblent être conscients de la dégradation de la qualité de circulation et des conditions de dysfonctionnement de déplacements privés à partir desquelles les comportements vont être modifiés. Dans l'optique de gain du temps et de la réduction de la consommation énergétique, un péage de stationnement vient limiter l'accès au centre-ville. Il s'agit d'une nouvelle politique de développement de la grande Sfax. Nous avons présenté le projet de péage urbain comme solution tarifaire pour réduire les problèmes d'embouteillage, de stationnement mais notamment de financement. En déterminant une valorisation monétaire des attributs déterminants la demande (par exemple quel niveau de prix les individus considèrent-ils comme acceptables pour utiliser les transports collectifs et renoncer à leurs voitures), elle donne une évaluation chiffrée du seuil susceptible d'allier le comportement des déplacements.

Abstract

In this paper there are analysed the impacts of capital investments, education and technology on the European countries' productivity, seen as a key dimension of economic growth and competitiveness. Using econometric instruments, such as Pearson correlations, Granger causality and Panel Least Squares method, there are processed data for 20 European countries, OECD members, for the period 2000-2013. The results reveal that gross capital formation education and technology were the most significant positive determinants of productivity, but the manifestation of the financial crisis had the most significant negative effects on productivity, while foreign direct investments inflows had insignificant impact. Moreover, foreign direct investments inflows appears to be the only variable that does not appear to have a causal relationship with productivity.

Keywords: productivity growth, gross capital formation, foreign direct investments, education, technology, crisis

Introduction

Each and every country or the groups of countries, including European Union, are concerned by the necessity of reaching and maintaining sustainable development and economic growth, but also of gaining more competitive advantage compared to other countries. However, such ambitious targets cannot be reached if they do not improve their productivity, which represents a key dimension of economic growth and competitiveness and this is why understanding and controlling the main drivers of productivity has to be one of the most important themes to be analysed. Moreover, while the macroeconomic climate is from time to time affected by serious and dangerous phenomena as economic and financial crisis, it is equally important to find the appropriate levers to surpass those hard times with minimum losses.

Starting from the above considerations, we consider in this paper that the period starting from 2000 till 2013, marked partially also by the manifestation of a severe economic and financial crisis, can be a good basis for an analysis on the impacts of determinants such as investments in capital, education and technology on productivity in Europe.

Literature Review

Enhancing economic performance and ensuring sustainable development are undoubtedly major concerns for each country and, at the same time, important subjects for research. However, we remark that in literature most of the studies are focused more on the economic growth determinants and less on the factors that are driving labour productivity growth.

Defined most often as the ratio between the volume of output and the volume of inputs, productivity measures how efficiently are used different kinds of inputs in an economy in order to maximize the output, proxied usually by GDP growth (OECD, 2015). In this context, even it cannot be forgotten the effects of some macroeconomic determinants such as inflation, unemployment etc., it is acknowledged in literature (OECD, 2015) that an important growth in labour productivity is reflecting an increase and a better use of capital, either fixed or human, or efficiency gains by innovation or by enhancing the work abilities of the employees.

There are many different theoretical approaches of economic growth and productivity in literature. However, most of them sustain practically two main ideas regarding the determinants of growth. Thus, while the neoclassical theory, launched by Solow (1956), sustains that capital accumulation is the essential driver of productivity and economic growth, the second one, theory of endogenous growth, developed by Romer (1986) and Lucas (1988) considers human capital and innovation capacity as the most representative determinants.

According to the neoclassical theory of Solow capital accumulation may be considered as a major determinant of productivity and there are many reasons for sustaining such an idea, especially if taking into consideration that the output is strongly determined by the dimension of the means involved in the economic process, out of which a very important part is represented by the fixed capital and the inventories which are completed also by the human capital. In this regard, investments in capital, either domestic or foreign, are essential for enhancing the level of the productivity.

Domestic investments in capital is proxied usually in literature by gross capital formation annual growth indicator and measures the increase of the fixed assets in the economy and the net changes in the level of inventories. As part of gross fixed capital formation, growth in fixed assets as land improvements, plants, machineries and equipment purchases, but also in constructions of roads, railways, including schools, offices, hospitals, private commercial and industrial buildings are significantly growing the productive capacity of the country and, when completed by higher inventories, are enhancing thus the productivity of the labor force (Wolff, 1991; Zheng et al., 2009; Fleisher et al., 2010).

On the other hand, investments in capital may come also from outside the country, by foreign direct investments inflows. As literature confirms, most of the times foreign direct investments have a positive impact on productivity (Borensztein et al., 1988; Keller & Yeaple, 2003, Griffith et al., 2003). However, Aitken and Harrison (1999) found a negative impact of FDI on productivity in Venezuela, while other authors (Hanson, 2001, Alfaro et al., 2004) found questionable or non-existent effects of FDI on productivity and economic growth, which makes ambiguous the link between FDI and productivity.

In literature was found also in many empirical papers (Loko & Diouf, 2009; Fleisher et. al. 2010) that human capital quality plays a major role in enhancing productivity, the most important impact being induced especially by the level of education (Barro & Lee, 2000). Moreover, the level of education may have an important effect on productivity growth because of its role as a determinant of an economy's capacity to carry out technological innovation (Romer, 1990) and to implement the new technologies.

Technology represents, in turn, another important determinant of productivity in a country. This fact is sustained mainly by the adepts of theory of endogenous growth, but it is also confirmed by many specific studies (Chen & Dahlman; Fleisher et al. 2010). In this regard, such studies have stressed the importance of ICT (information and communication technology) in sustaining long term economic growth and productivity.

We also believe that productivity is depending on the specific macroeconomic developments especially on the manifestation of some profound negative phenomena such as financial and economic crisis, which affect the economic activity.

Data and Methodology

Starting from the findings made in literature, as mentioned above, our research makes an empirically analysis on the impact of the capital accumulation and technology on the labour productivity in European countries, aiming to identify how strong are the effects generated by these factors and to draw conclusions regarding the way productivity may be enhanced.

We have concentrated our analysis on a selected group of 20 European countries, which are members of EU and also of OECD, which are: Austria, Belgium, Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Ireland, Italy, Netherlands, Poland, Portugal, Slovak Republic, Slovenia, Spain, Sweden and UK. For these countries, we will use annual data taken from the OECD database and Global Financial Development Databank (GFDD) of World Bank, for the period from 2000 till 2013, which will be processed and analysed employing econometric instruments such as Pearson Correlations and Granger Causality Analysis, but also by building and testing a regression model using Panel Least Squares method.

In order to assess the labour productivity evolution, we use the labour productivity annual growth indicator, from the OECD database, which will be considered in our econometric study as the depending variable, symbolized as PGR.

We use more than one indicator for estimating the impact of capital accumulation, due to the various ways in which it can be gained and of the different effects that may result on labour productivity according to the the specific used capital. Thus, we take into consideration both the effects brought by domestic capital but also of the foreign direct investments inflows. Moreover, we consider the domestic investments not only in terms of fixed capital (gross fixed capital formation), but also in terms of fixed assets plus inventories (gross capital formation). Going further we estimate the impact of human capital by the level of education of the labour force. Finally, we take into consideration technological advance as determinant of productivity.

The impact factors on labour productivity growth, considered in our analysis also as independent variables, including their expected positive or negative relationship with the dependent variable are synthetized in Table 1.

Table 1: Impact factors - Independent variables

Independent variable/ Determinant	Indicator	Abbrevia-tion	Expected relationship (+/-)	Source
Domestic capital investment growth	Gross capital formation annual growth (%)	GCFGR	+	World Bank GFDD database
Domestic fixed capital investment growth	Gross fixed capital formation annual growth (%)	GFCFGR	+	World Bank GFDD database
Foreign direct investments inflows	Change in Foreign Direct Investments net inflows as percentage of GDP (%)	ΔFDII_G	+	World Bank GFDD database
Education	Change in labor force with tertiary education (of total) (%)	ΔL_TED	+	World Bank GFDD database
Technology advance	Change in mobile cellular subscriptions per 100 people (%)	ΔMOBS	+	World Bank GFDD database
Crisis	Crisis	CRISIS	-	dummy

As table 1 confirms, we have considered necessary to take into account in estimating the effects on productivity also of the financial crisis manifestation, which determined, in the analysed period, significant changes. Thus, we introduced also the dummy variable "crisis", marking the crisis period.

Results and Comments

In order to confirm the existence of the linkages between the evolution of labour productivity and the considered impact factors we used first Pearson correlations to process the panel of data for the European countries which are studied and the results obtained are those in Table 2.

Table 2: Correlations of productivity growth with the considered determinants

Sample: 2001 2013							
Included observations: 260 after adjustments							
Correlation Coef./Probability	PGR	GCFGR	GFCFGR	ΔFDII_G	ΔL_TED	ΔMOBS	CRISIS
PGR	1.000000						

GCFGR	0.470860***	1.000000					
	0.0000	-----					
GFCFGR	0.395986***	0.917293***	1.000000				
	0.0000	0.0000	-----				
ΔFDII_G	0.071724	0.141391**	0.100529	1.000000			
	0.2491	0.0226	0.1058	-----			
ΔL_TED	0.085585	-0.049008	-0.058324	-0.083109	1.000000		
	0.1689	0.4313	0.3489	0.1816	-----		
ΔMOBS	0.256086***	0.360961***	0.411910***	0.038545	-0.106289*	1.000000	
	0.0000	0.0000	0.0000	0.5361	0.0872	-----	
CRISIS	-0.296248***	-0.376227***	-0.421646***	-0.129651**	0.094566	-0.351808***	1.000000
	0.0000	0.0000	0.0000	0.0367	0.1283	0.0000	-----

***, **,* - denotes significance at 1%, 5%, respectively 10% level

Analysing the data in Table 2, we note first that they confirm the expected signs of the linkages between the labour productivity growth and the impact factors. There result significant positive correlations of labour productivity growth with domestic capital accumulation, both in relation with gross capital formation growth (coef. = 0.4708, Prob. = 0.0000) and with the gross fixed capital formation growth (coef. = 0.3959, prob. = 0.0000). They reflect, thus, strong linkages of productivity with the additions to the fixed assets of the economy, but also, in a smaller part, with the changes in the level of inventories. On the other hand, the change in foreign direct investments inflows and the labour force education appear to have positive but not significant relationships with productivity.

Results in table 2 are confirming also the existence of a significant relationship between technological advance and productivity and, at the same time, a negative correlation of productivity with crisis manifestation, as expected.

While the results obtained regarding the correlations do not confirm also the cause-effect directions of the linkages found we performed also pairwise Granger causality tests the results being shown in Table 3.

Table 3: Pairwise Granger Causality Tests

Sample: 2000 2013 Lags: 3			
Null Hypothesis:	Obs	F-Statistic	Prob.
GCFGR does not Granger Cause PRD	220	5.10420	0.0020
PRD does not Granger Cause GCFGR		3.56918	0.0150
GFCFGR does not Granger Cause PRD	220	3.63604	0.0137
PRD does not Granger Cause GFCFGR		4.94147	0.0024
ΔFDII_G does not Granger Cause PRD	200	1.76134	0.1559
PRD does not Granger Cause ΔFDII_G		1.41974	0.2383
ΔLF_TED does not Granger Cause PRD	200	4.50732	0.0044
PRD does not Granger Cause ΔLF_TED		0.43711	0.7267
ΔMOBS does not Granger Cause PRD	200	4.24926	0.0062
PRD does not Granger Cause ΔMOBS		3.26782	0.0224
CRISIS does not Granger Cause PRD	220	21.2885	4.E-12
PRD does not Granger Cause CRISIS		10.0170	3.E-06

According to data in Table 3 it results that except in the case of the change in foreign direct investments inflows in which the hypothesis that it does not Granger cause productivity is not rejected, all the other factors are Granger causing productivity growth. Moreover, excepting the case of foreign direct investments inflows and education, in all the other cases can be found also reverse causal relationships.

The above considerations and the results already obtained, sustain the possibility of deepening the analysis of the impacts of the considered determinants on labour productivity growth in the selected 20 European countries. In this regard, we will use further the Panel Least Squares method to build and test the following econometric regression model (1) for revealing the level of these impacts:

$$y_{jt} = c + \sum_{i} \beta_i \bullet X_{ijt} + \varepsilon \qquad (1)$$

where, j stands for the specific country, t stands for the year, y represents labour productivity growth, Xi represent the impact factors considered, βi are the coefficients of the impact factors and ε stands for the error term.

We tested the model on the data of the 20 European countries for determining effects of the impact factors on labour productivity growth, for the period 2000- 2013, leading us to the results presented in Table 4:

Table 4: Results of testing the proposed model for productivity growth

Dependent Variable: PGR				
Method: Panel Least Squares				
Sample (adjusted): 2000 2013				
Periods included: 13 Cross-sections included: 20				
Total panel observations: 260				
Variable	Coefficient	Std. Error	t-Statistic	Prob.
GCFGR	0.165172	0.032086	5.147864	0.0000
GFCFGR	-0.100146	0.040615	-2.465743	0.0143
ΔFDII_G	-0.001580	0.014309	-0.110413	0.9122
ΔL_TED	0.349586	0.151265	2.311079	0.0216
ΔMOBS	0.036420	0.020877	1.744504	0.0823
CRISIS	-0.751259	0.295682	-2.540765	0.0117
C	0.165172	0.032086	5.147864	0.0000
R-squared	0.275166	F-statistic		16.00759
Adjusted R-squared	0.257976	Prob(F-statistic)		0.000000

The results show, first of all, that labour productivity growth is depending quite significantly (R-squared = 0.2752, Adjusted R-squared = 0.2579) on the considered factors, even its evolution appears to be determined also by other variables.

We note that, for the countries considered, gross capital formation growth had the most important positive impact, statistically significant under the threshold of 1%. Moreover, another important positive effect on labour productivity growth was induced by the level of the education of labour force, significantly below the threshold of 5%, while technology had also a positive impact, below the threshold of 10%.

On the other hand, as expected, crisis appears to be the most significant negative impact factor on the labour productivity. However we observe once again that foreign direct investments inflows had an insignificant, and even negative, effect on labour productivity growth, while gross fixed capital formation growth appears unexpectedly to have had a negative influence. Under these circumstances, we may conclude that the level of the foreign direct investments inflows, but also the level of investments in fixed assets was insufficient to enhance labour productivity.

Conclusions

Our study consists in an analysis, using econometric methods, made for the 2000-2013 period, on 20 European countries, OECD members, regarding the impact on labour productivity induced by the technological advance and by the increase of the investments in capital, both fixed and human, the latter from the perspective of the level of education of labour force. Moreover, the study takes into consideration the side effect of the crisis manifestation on productivity.

Our findings show for the analysed panel of countries that labour productivity is significantly positive correlated with gross capital formation and technology, but significantly negative correlated with crisis manifestation, while foreign direct investments and education show positive but less significant correlations with productivity. Moreover, analysing the causal relationship between productivity and the other variables we found that except foreign direct investment inflows, in all other cases, productivity appears to be determined by the considered variables.

Deepening our analysis, we have built and tested a regression model based on Panel Least Squares Method, which has led to the conclusion that over the 2000-2013 period, in the 20 European countries, productivity was significantly positive influenced by the domestic investments in capital,

by the level of education of the labour force and by the use of new technologies, but crisis manifestation had an important negative impact on productivity. On the other hand, foreign direct investments had a very insignificant, yet negative impact on productivity, which suggests that the level of them was too low to make a difference. Under these circumstances, it results that the analysed countries should direct their efforts in order to invest more in their fixed and human capital, but also in technology and should try to attract significant foreign investments.

Abstract

Nowadays, the user demand for accurate information is still increasing, especially, with the expansion of numeric Arabic information in the Web. This growing is not only devoted to consult the existing documents on the Web, but also to build corpus for several applications of natural language, such as, question-answering, machine translation, information retrieval, etc. In this paper, we introduce a presentation and an implementation of Arabic corpus of questions-texts. This corpus, called AQA-WebCorp (Arabic Question Answering Web Corpus), revealed a real automatic interrogation of Google, in order to generate passages of texts whose the answer of a given question is located. This constitution then will provide a better base for our experimentation step. Thus, we try to model this constitution by a method for Arabic insofar as it recovers texts from the web that could prove to be answers to our factual questions. To do this, we had to develop a java script that can extract from a given question an html page. Then, clean this page to the extent of having a data base of passages to build our corpus. In addition, we give the preliminary results of our proposal method. Finally, some investigations for the construction of Arabic corpus are also described.

Keywords: AQA-WebCorp, Web, corpus, URL, question, texts, Corpus building, Google.

Introduction

Today, the World Wide Web has been a driving force in innovations within information retrieval, as users worldwide use search engines to find relevant content on the web. For question-answering, information retrieval methods are used for retrieving documents relevant to the question, and selecting documents likely containing the answer. Most question-answering systems use existing search engines.

The corpus (singular form of corpora[1]) construction is a task that both essential and delicate. It is complex because it depends in large part a significant number of resources to be exploited. In addition, the corpus construction is generally used for many NLP applications, including machine translation, information retrieval, question-answering, etc. Several attempts have succeeded of building their corpus. According to Sinclair (2005), a corpus is a collection of pieces of texts in electronic forms, selected according to external criteria for end to represent, if possible, a language as a data source for linguistic research. Indeed, a definition that is both specific and generic of a corpus according Rastier (2005) is the result of choices that brings the linguists. A corpus is not a simple object; it should not be a mere collection of phrases or a "bag of words". This is in fact a text assembly that can cover many types of text.

With the internet development and its services, the web has become a great source of documents in different languages and different areas. This source is combined with storage media that allow the rapid construction of a corpus Meftouh et al (2007). In addition, using the Web as a base for the establishment of textual data is a very recent task. The recent years have taken off work attempting to exploit this type

[1] McEnery (2003) pointed out that corpuses is perfectly acceptable as a plural form of corpus.

of data. From the perspective of automated translation in Resnik et al (1998), the others study the possibility of using the websites which offering information in multiple languages to build a bilingual parallel corpus.

Arabic is also an international language, rivaling English in number of native speakers. However, little attentions have been devoted to Arabic. Although there have been a number of investigations and efforts invested the Arabic corpus construction, especially in Europe. Progress in this area is still limited. In our research, we completed building our corpus of texts by querying the search engine Google. We are concerned our aim, a kind of, giving a question, analyzing texts at the end to answer this question.

This paper is organized into six sections as follows: it begins with an introduction, followed by use of the web as a corpus source. Section 3 outlines the earlier work in Arabic; Section 4 shows our proposed approach to build a corpus of pairs of questions and texts; Section 5 describes an experimental study of our approach; a conclusion and future work will conclude this article.

1. Using the Web as a Source of Corpus

Nowadays, the web has a very important role in the search for information. It is an immense source, free and available. The web is with us, with a simple click of the mouse, a colossal quantity of texts was recovered freely Gatto (2011). It contains billions of text words that can be used for any kind of linguistic research Kilgarriff and Grefenstette (2001). It is considered the greatest knowledge resource. Indeed, the current search engines cannot find extracts containing the effective answers to a user question. Which sometimes makes it difficult to get accurate information; sometimes, they can't even extract the correct answers. The web is also an infinite source of resources (textual, graphical and sound). These resources allow the rapid constitution of the corpus. But their constitution is not easy so that it raises a number of questions Isaac (2001).

The construction of a corpus of texts from the web was not a simple task. Such constitution has contributed to developing and improving several linguistic tools such as question-answering systems, information extraction systems, machine translation systems, etc.

In fact, one of the most interesting Web intrinsic characteristics is its multilingual. As for the current distribution of languages used on the Web, recent estimates of the top ten languages (30 June 2015[2]) report that English and Chinese are the most used languages, followed by Spanish. The Arabic is a fourth on Internet users by language, followed by other major languages such as Portuguese, Japanese, Russian, German, Malay, French, and German.

Our intent is threefold. First, the empirical evaluation must be based on a relevant corpus. Secondly, we seek to analyze our built corpus. Finally, the main purpose of our research concerns the search for an accurate answer to a question in natural language. That is why we considered the Web as a source of potential to build our corpus.

2. Literature Review: Arabic Corpus Construction from the Web

The corpus is a resource that could be very important and useful in advancing the various language applications such as information retrieval, speech recognition, machine translation, question-answering, etc. This resource has gained much attention in NLP. The task of building a corpus of textual resources from the web is somewhat recent. In Arabic, the attempts to exploit this type of data are limited. Although

[2] www.internetworldstats.com

there has been some effort in Europe, which led to the successful production of some Arabic corpus; Progress in this field is still limited. According to Atwell et al (2004), the progress has been hampered by the lack of effective corpus analysis tools, such as taggers, stemmers, readable dictionaries to the machine, the corpus viewing tools, etc., that are required for build and enrich a corpus as a research tool.

Although many researches are available to document corpus construction in English and other languages, there are some publicly accessible corpuses, especially in Arabic. This language has not received the attention that it deserves in this area. In this regard, many researchers have emphasized the importance of a corpus and the need to work on their construction. For his part, Mansour (2013), in his work, showed that the contribution of a corpus in a linguistic research is a huge of many ways. In fact, as such a corpus provides an empirical data that enables to form the objective linguistic declarations rather than subjective. Thus, the corpus helps the researcher to avoid linguistic generalizations based on his internalized cognitive perception of language. With a corpus, the qualitative and quantitative linguistic research can be done in seconds; this saves the time and the effort. Finally, the empirical data analysis can help the researchers not only to precede the effective new linguistic research, but also to test the existing theories.

In this section, we present the most significant studies on English corpus construction and previous attempts to build a corpus in Arabic. In addition, we will also cover the studies that claim the construction of corpus for question-answering. There are now numerous studies that use the Web as a source of linguistic data. Here, we review a few studies for the Arabic language, as our case, that use the search engines queries to build a corpus.

Among the most recognized Arabic corpus construction projects, we cite, for example, the work of Resnik which studies the possibility of using the websites offers the information's in multiple languages to build the bilingual parallel corpora Resnik (1998).

Ghani and his associates Ghani et al (2001) performs a study of building a corpus of minority languages from the web by automatically querying the search engines.

In order to study the behavior of predicate nouns that highlight the location and movement, the approach proposed by Isaac and colleagues Isaac et al (2001) developed software for the creation of a corpus of sentences to measure if the introduction of prepositions in queries, in information retrieval, can improve the accuracy.

Even more, the work of Baroni and Bernardini (2004) introduced the "BOOTCAT Toolkit". A set of tools that allow an iterative construction corpus by automated querying the Google and terminology extraction. Although it is devoted to the development of specialized corpora, this tool was used by Ueyama and Baroni (2005) and Sharoff (2006) to the generalized corpus constitution.

Similarly, the work of Meftouh et al (2007) describes a tool of building a corpus for the Arabic. This corpus automatically collected a list of sites dedicated to the Arabic language. Then the content of these sites is extracted and normalized. Indeed, their corpus is particularly dedicated for calculating the statistical language models.

In another approach of Elghamry in which he proposed an experiment on the acquisition of a corpus from the web of the lexicon hypernymy-hyponymy to partial hierarchical structure for Arabic, using the pattern lexico-syntactic "بعض x مثل y1 ... yn" (certain x as y1, ... yn) of Elghamry (2008).

From the perspective of automatic summarization, Maâloul et al (2010) studied the possibility of extracting Arabic texts of the website "Alhayat" by selecting newspaper articles of HTML type with UTF-8 encoding, to locate the rhetoric relations between the minimum units of the text using rhetorical rules. In addition, Ghoul (2014) provides a grammatically annotated corpus for Arabic textual data from

the Web, called Web Arabic corpus. The authors note that they apply the "Tree tagger" to annotate their corpus based on a set of labels. This corpus consists of 207 356 sentences and 7 653 881 words distributed on four areas: culture, economy, religion and sports.

Finally, in Arts et al (2014) the authors present arTenTen, an Arabic explored corpus from the web. This one is a member of the family of Tenten corpus Jakubíček et al (2013). arTenTen consists of 5.8 billion words. Using the JusText and Onion tools, this corpus has been thoroughly cleaned, including the removal of duplicate Pomikalek (2011). The authors use the version of the tool MADA 3.2 for marking task, lemmatization and part-of-speech tagging of arTenTen (Habash and Rambow (2005), Habash et al (2009). This corpus is compared to two other Arabic corpus Gigaword Graff (2003) and an explored corpus of the web Sharoff (2006).

Documents on the web have also operated by other approaches and other researchers Volk (2001), Volk (2002), Keller and Lapata (2003), Villasenor-pineda et al (2003) to address the problem of the lack of data in statistical modeling language Kilgarrif and Grefenstette (2003). In Elghamry et al (2007), these data were used to resolve anaphora in Arabic free texts. Here, the authors construct a dynamic statistical algorithm. This one uses the fewest possible of functionality and less human intervention to overcome the problem lack sufficient resources in NLP. However, Sellami et al (2013) are working on, the online encyclopedia, Wikipedia to retrieve the comparable articles.

In a merge of search engine and language processing technologies, the web has also been used by groups in Sheffield and Microsoft among others as source of answers for question-answering applications Mark et al (2002), Susan et al (2002). AnswerBus of Zhiping (2002) allows answering the questions in English, German, French, Spanish, Italian and Portuguese.

Although the text corpus building efforts are focused on English, Arabic corpus can also be acquired from the Web which is considered as a large data source. These attempts might be in all of the NLP applications. However, we also note significant efforts mainly for the question-answering. In this regard, the major of our knowledge, the number of corpus dedicated to Arabic question-answering is somewhat limited. Among the studies that have dedicated to this field, we cite Trigui et al (2010) who built a corpus of definition questions dealing the definitions of organizations. They use a series of 50 organization definition questions. They experienced their system using 2000 extracts returned by the Google search engine and Arabic version of Wikipedia.

We conclude that the natures of web texts are liable to be show up in many applications of automatic processing Arabic language. There are, at present, a number of construction studies of texts corpus in various applications, including the named entity recognition, plagiarism detection, parallel corpus, anaphora resolution, etc. The efforts to build corpus for each application are significant. They could be in all NLP applications.

3. Presentation of AQA-WebCorp: Arabic Question-Answering Web Corpus

In the rest of this article, we show in detail our suggestion to build our corpus of pair's questions and texts from the web as well as our preliminary empirical study. In our case, the size of the corpus obtained depends mostly on the number of questions asked and the number of documents selected for each question.

In the context of their construction of a corpus of texts from the web, researchers in Issac et al (2001) point out that there are two ways to retrieve information from the web for building a corpus. The first one is to group the data located on known sites Resnik (1998). Indeed, this way runs a vacuum cleaner web. This ensures the recovery of the pages from a given address. However, the second method investigates a

search engine to select addresses from one or more queries (whose the complexity depends on the engine). Thereafter, recover manually or automatically the corresponding pages from these addresses.

In our work we follow the second method. From a list of questions posed in natural language, we ensure the recovery of the list of corresponding URLs. Then, from these URLs, we propose to recover the related web pages. Eventually, we propose to clean these pages so as to produce the lists of texts that will be the foundation that built our corpus. After building our corpus of pair's questions and texts, we do not keep it to that state. In this respect, a stage of analysis and processing will be looked later to achieve our main objective which is the extraction of an adequate and accurate answer to each question.

5.1 Collection of the questions

It is comes to collect a set of questions in natural language. These questions can be asked in different fields, including sport, history & Islam, discoveries & culture, world news, health & medicine.

Currently, our corpus consists of 115 pairs of questions and texts. Indeed, the collection of these Questions is carried out from multiple sources namely, discussion forums, frequently asked questions (FAQ), some questions translated from the two evaluation campaigns TREC and CLEF (Figure 1).

The data collected from the web of the questions and the texts will help us to build an extensible corpus for the Arabic question-answering. The size of our corpus is in the order of 115 factual questions: 10 questions translated from TREC, 10 questions translated from CLEF and 95 questions gathered from the forums and FAQs. To build our corpus, we used the Arabic texts available on the Internet that is collected being based on the questions posed at the outset.

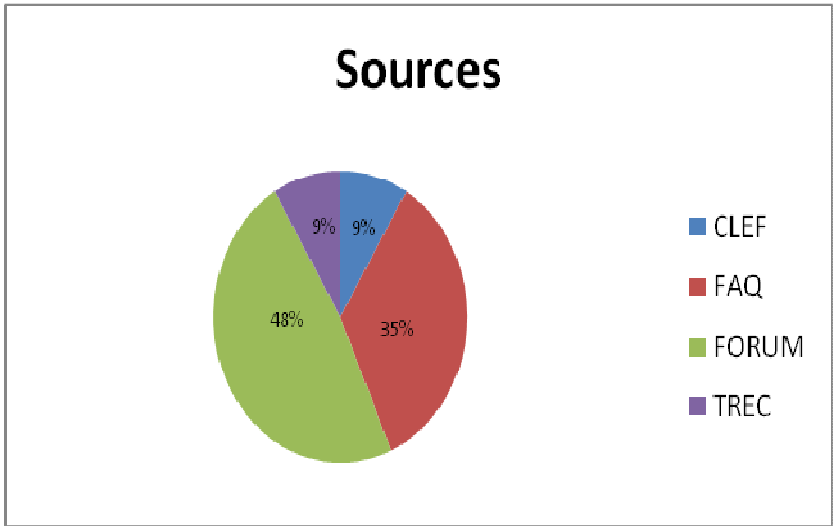

Fig 1: Source of the questions used for our corpus

From a perspective of analysis and post processing carried out to our corpus taking into account the form and the content of the corresponding questions, we collected factual questions having the type (What, Where, When, Who, How) (ما , أين, متى, من كم) (Figure 2).

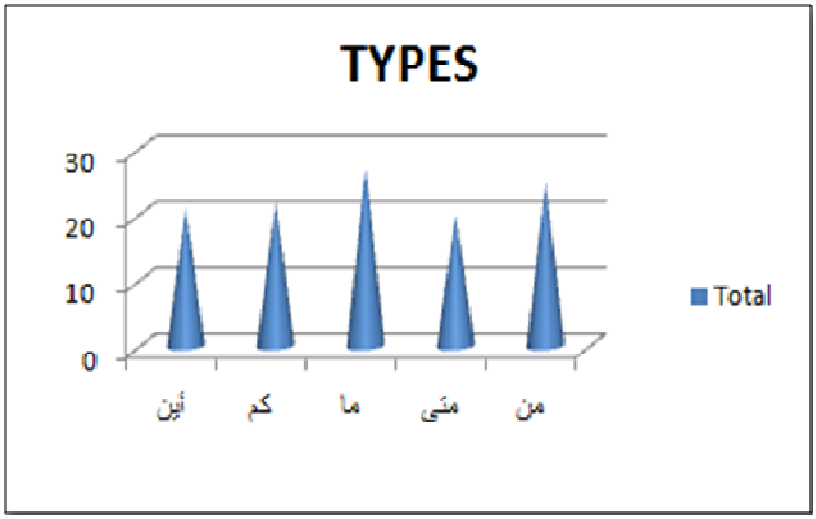

Fig 2: Some examples of questions used in our corpus

5.2 The steps of construction

Most studies in Arabic corpus construction are designed for areas other than the question-answering (see figure 3). According to a research done at Google[3], we find that the number of attempts devoted to this area is so limited. That's why we decided to build our own corpus. To address this goal we need as an intermediate step interrogating a search engine. The construction of the corpus for the question-answering gets better. We hope that it will continue to improve in the coming years and will complete one day to produce corpus in this field of research that will be used by researchers in their empirical studies.

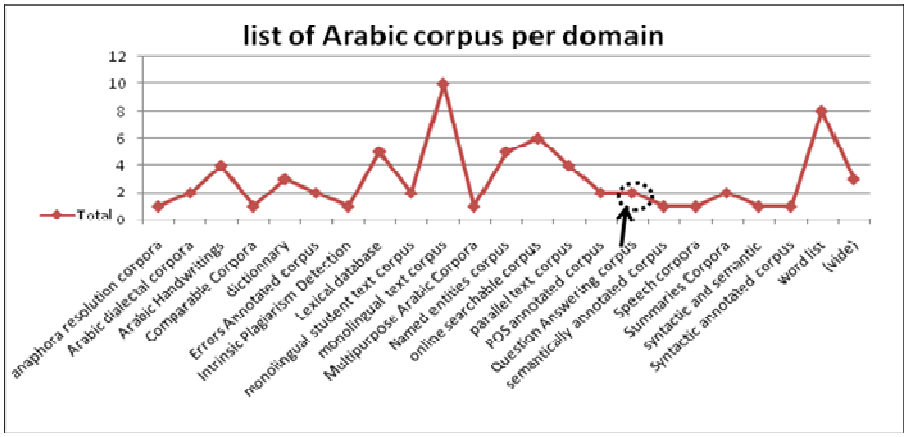

Fig 3: List of Arabic corpus per domain

[3] http://www.qatar.cmu.edu/~wajdiz/corpora.html

To implement our corpus for Arabic, we propose a simple and robust method implemented in Java. The principle of this method is based on four stages, relatively dependent. The constitution of our corpus of pairs of Arabic question and texts is actually done by developing all of these four steps. We describe in the following each of these steps:

- Documents research
- Web pages recovery
- Texts preparation
- Texts classification

This methodological framework is to look for web addresses corresponding to each question. Indeed, we have segmented questions in a list of keywords. Then our tool seeks list of URLs addresses which match those keys words. Then, for each given address we propose to recover the webpage that suits him. In this respect, our corpus construction tool is an interface between the user request and Google. Specifically, it is a way to query the Google database to retrieve a list of documents. Finally, we performed a transformation of each retaining web page from (".html" →".txt"). Finally, we look for if the answer is found in the correspondent text. The text is considered valid to build our body if it contains this answer. Otherwise, we go to the following URL.

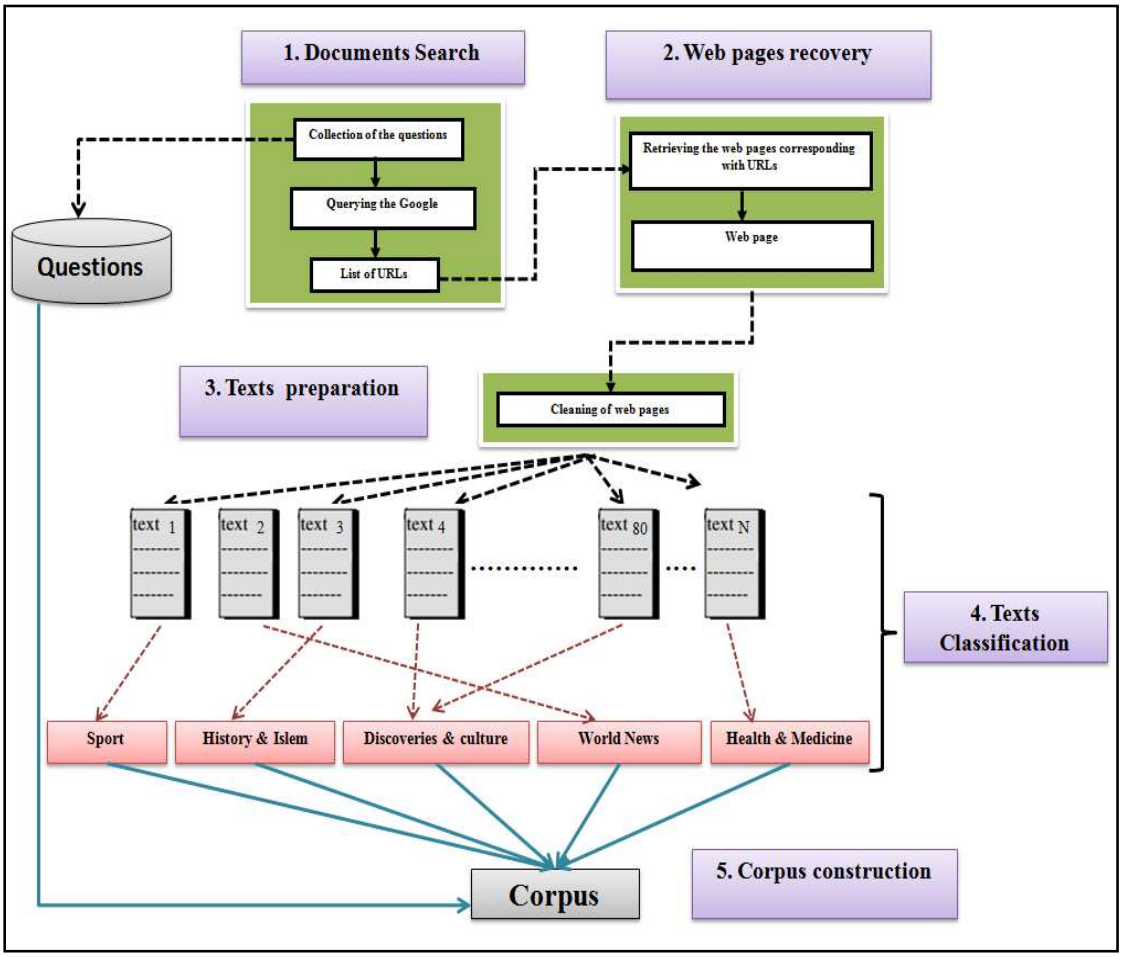

Fig 4: Construction process of our corpus AQA-WebCorp

As illustrated in the (figure 4), we introduce in this section a simple method of construction of our corpus promoting an effective interrogation of the web. This method is generally composed of three modules. Given a module for generating list of URLs address is implemented, this module supports for any questions posed in natural language a list of corresponding URLs. Next, a processing module behaves like a corresponding web page generator. A third module provides a sort of filtering of these pages. The result of this module could be a set of texts that can be added to the questions to build our corpus from the web.

4. Empirical Assessment

The first stage consists from a question posed in natural language, to attribute the list of URLs corresponding addresses to it. Indeed, the documents search is done being based on the words of the collected questions. A better to ensure this step we developed a java script for interrogating Google to obtain these results. The result of this step is a set of URLs addresses. For each question a list of the URLs will be affected.

In our case, to look for an answer to a question in Arabic, we propose to use a search engine (i.e. Google) to retrieve the documents related to each question. Then add post linguistic treatments to those documents which are actually constitute our corpus to have an accurate and appropriate answer. In this respect, querying a search engine accelerates the recovery of documents online but requires an offline processing of these documents. We think that this is a better solution, but much more complex is the implementation of a Linguistic search engine for a particular purpose.

At this stage, the module of documents search is implemented. First, when a question is asked, our tool submits it to the search engine (Google) to identify the list of URLs based on a list of words constitute this question.

Consider the following example: our tool can then from the question: « من صمم برج ايفل ؟ » Generate a list of equivalent URLs addresses. The default Web access means is through a search engine such as Google. In addition, by clicking the "search URLS" button, a list of addresses will be automatically displayed. While for each URL, this prototype can retrieve the necessary information's (host, query, protocol, etc.).

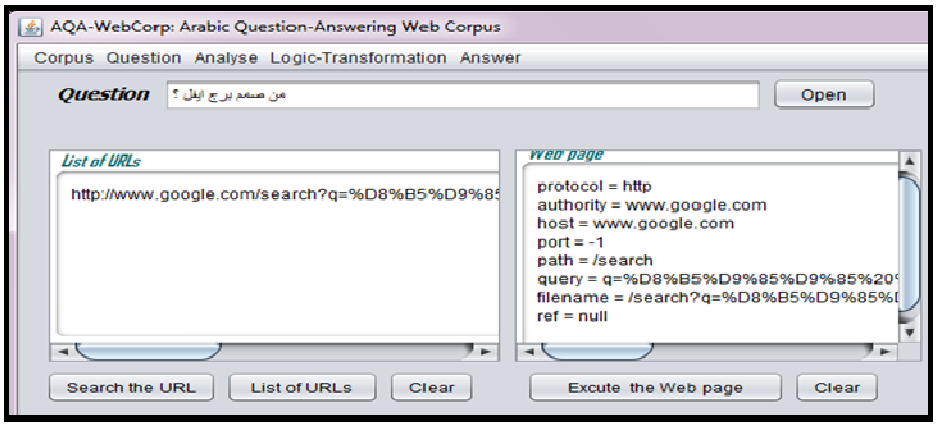

Fig 5: List of URLs generated for the question: " من صمم برج ايفل ؟ "

Once the list of URLs is generated, our tool must determine for each address the corresponding web page. This is to look for the corresponding HTML page for each given URL. The following figure illustrates

this case. From the address retained in the first step, a set of web pages is recovered. Each of these pages is exported in the format ".html".

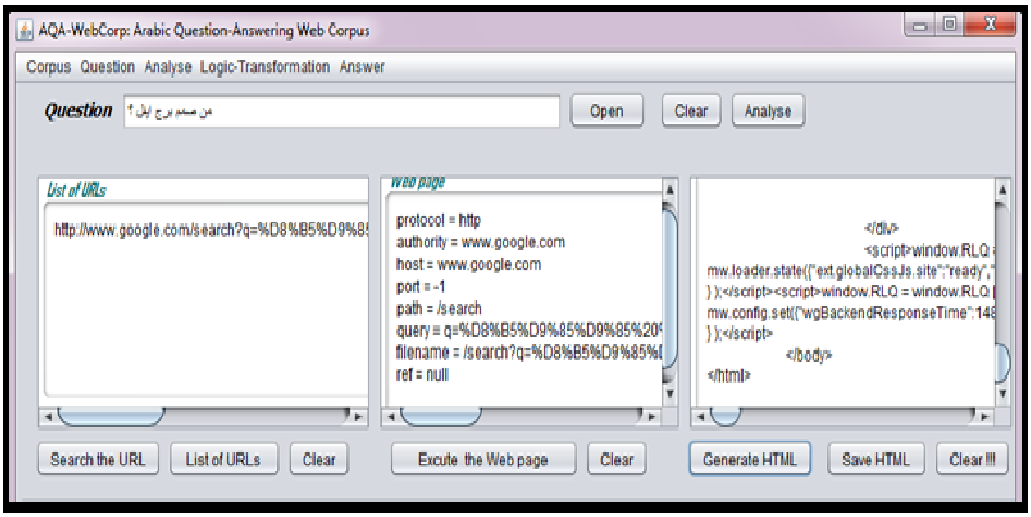

Fig 6: An URL of a web page retaining from the question:" من صمم برج ايفل ؟ ".

The figure below is an actual running of our prototype, using the previous steps of figure 6. The "generate HTML" button retrieves a page from its URL (figure 7).

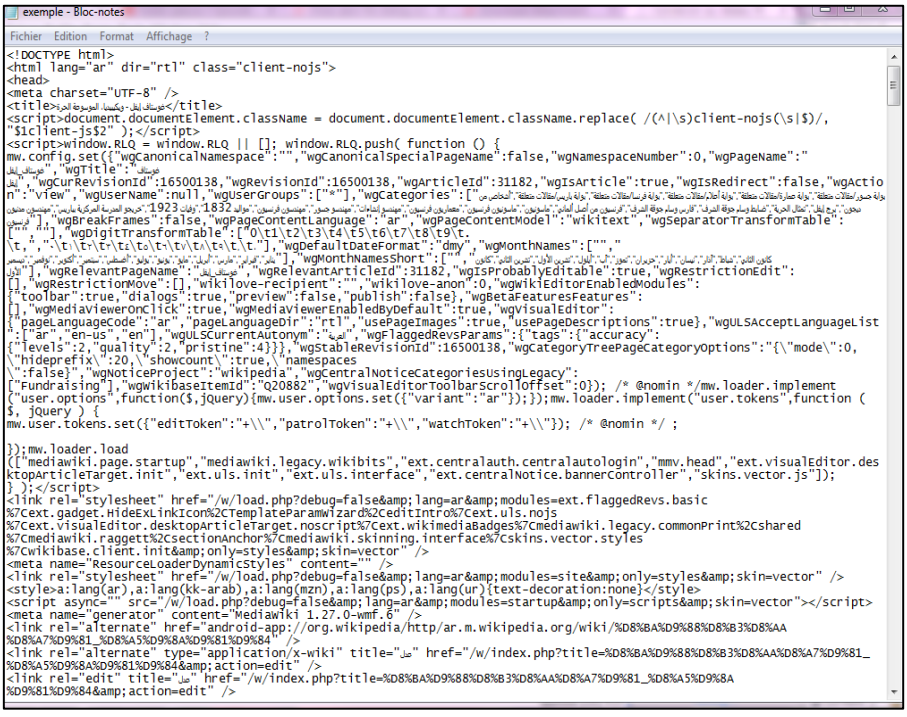

Fig 7: HTML page generated

The last step is to transform every web page obtained in the previous step into a ".txt" format. The texts being in ".html" format, and given that the intended application is the statistical language modeling, it seems justified to put them in the ".txt" format. For this, we remove all the HTML tags for each retrieved pages. As we have said before, our method seeks answers to each question in each generated text. It is possible either is to keep the text for own corpus construction work, or to disregard it.

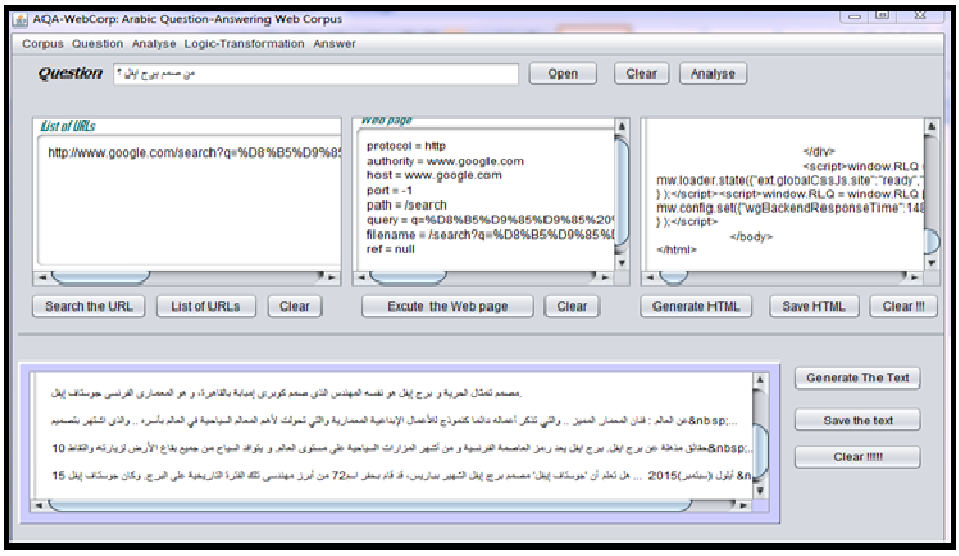

Figure 8: Example of a text containing an answer to the following question: " من صمم برج ايفل ؟ ".

When the text is generated it shall be ensured its suitability to answer the question put in advance, before saving it. To select this text, we proposed to select from the retained text list one which is to compile the most of information's related to the question. When this text is found, it is saved at the end of to be able to build our own corpus.

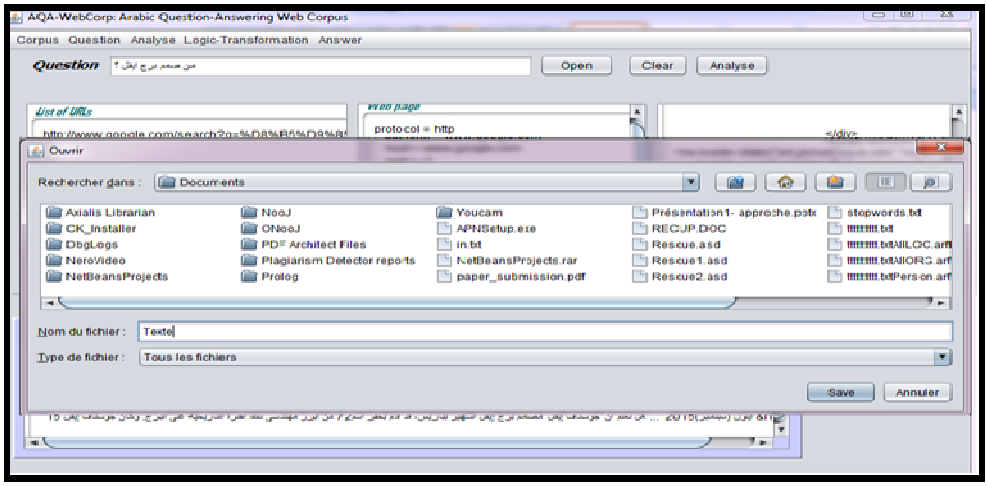

Figure 9: Saving the text

We are currently developing a corpus dedicated to the Arabic question-answering. The size of the corpus is in the order of 115 pairs of questions and texts. This is collected using the web as a source of data. The data collected, of these questions and texts from the web, will help us to build an extensible corpus for the Arabic question-answering. The pairs of texts-questions distributed on five areas "أخبار العالم ; التاريخ والإسلام; إكتشافات; ثقافةو ; رياضة; صحة و طب" as follows:

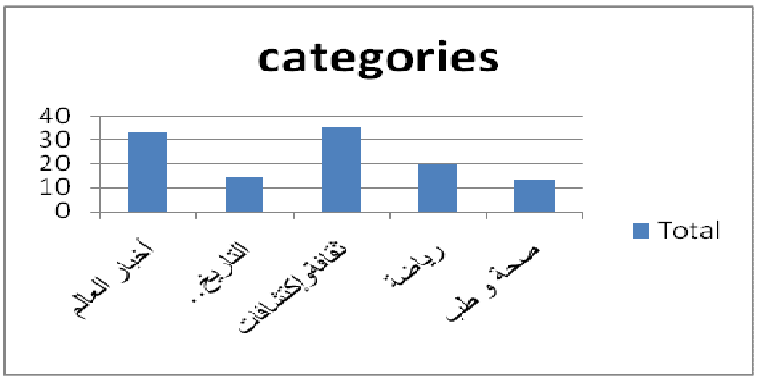

Figure 10: Statistics of pairs questions-texts used in different

Through the Google search engine, we develop a prototype that builds our corpus to Arabic question-answering. This corpus is in the order of 115 pairs of questions and texts. We are experimented our tool using 115 URLs returned by the search engine Google. Currently our corpus contains 115 pairs of questions and texts.

4.1 Results

We test our proposed method with a set of collected questions which consists of 115 factual questions. To evaluate our method, two performance measures are employed, such as Accuracy and c@1. These measures are used to measure the passages of texts automatically generated from the web that could answer those questions. In our case, there are some questions that are either not answered, either incorrectly answered. According to Peñas and Rodrigo (2011), not answering has more value than answering incorrectly. To evaluate those unanswered questions, we use the c@1 measure. It is an extension of accuracy measure (the proportion of correctly answered questions) with this feature and a very easy to understand interpretation. This measure has a good balance of discrimination power, stability and sensitivity properties.

CA: Number of Correctly Answers.
UQ: Number of Unanswered Questions.
TQ: Total of Questions.

The Accuracy measures the number of questions correctly answered divided by the total number of collected questions (correctly answered and not correctly answered).

- Accuracy = CA /TQ

The c@1 measures the proportion of correctly answered questions.

- C@1 = (CA + UQ * (CA / TQ)) / TQ

It should be noted that the number of questions correctly answered is 101, and the number of questions which are incorrectly answered or not answered is 14 questions. So we get an Accuracy of 0.87 and a c@1 of 0.98 (see table below).

Table 5: Results of preliminary experiments

	Correctly answered	**Unanswered = (incorrectly+ not (answered))**	**Total**	**Accuracy**	**c@1**
Number	101	14	115	0.87	0.98

Conclusion and Perspectives

It is undeniable that the Arabic corpus is certainly important for various applications in automatic natural language processing. This paper presents our first steps in this field towards the construction of a new corpus dedicated to the Arabic question-answering. It also presents our first version of the AQA-WebCorp (Arabic Question-Answering Web Corpus). It incorporates pairs of questions and texts of five categories, including («صحة و طب; رياضة; ثقافةو إكتشافات; التاريخ والإسلام; أخبار العالم»). The first phase focuses on Google search for documents that can answer every question, while the later phase is to select the appropriate text. In addition, to improve the quality of our current corpus, we propose to solve the problems mentioned above. Our task is still unfinished; we hope that we can continue to advance the construction of our body, so it could be effectively used for various purposes. It remains to perform post processing necessary to prepare the corpus for the second phase of representing these textual data into logical forms that can facilitate the extraction of the correct answer.

The proposed method is effective despite its simplicity. We managed to demonstrate that the Web could be used as a data source to build our corpus. The Web is the largest repository of existing electronic documents. Indeed, as prospects in this work, we have labeling this vast corpus and make it public and usable to improve the automatic processing of Arabic.

Privacy, security, ethical, and social issues in the authorization procedure for technical surveillance measures -A case study-

Sandra Gradinaru, Lecturer Dr., Alexandru Ioan Cuza University,
Faculty of Economics and Business Administration- Public Administration, Iasi, Romania,
email: sandra.gradinaru@yahoo.com.

Abstract

The present paper aims to analyze the possibility of examining the merits, in the preliminary proceedings chamber, of court orders issued by the judge of rights and freedoms through which have been acquiesced technical surveillance measures. We consider that this work is of interest given the obvious discrepancy between the definitive nature of the court order and the object of preliminary chamber ruling, in the light of the legality and validity of evidence acquired during prosecution. The majority of national court decisions reveals that the judge`s for rights and freedoms rulings trough which a measure of technical surveillance is authorized are subject to judicial control in preliminary chamber, but there are several courts in Romania that states otherwise.
Keywords: Preliminary chamber, technical surveillance measures, ruling, judicial control.

1. Introduction

In the case subjected to analysis, a criminal investigation was launched by the National Anticorruption Division (NAD), concerning crimes of traffic of influence, buying of influence and aiding and abetting.

Throughout the criminal investigation, the judge of rights and freedoms, at prosecutor's request, authorized the use of technical surveillance measures consisting in video surveillance and interception of electronic communications of the defendant. There were issued two warrants for technical surveillance, warrants that subsequently have been extended; to this extent was delivered a total of six ruling of the judge of rights and freedoms.

Regarding the first resolution, it is not the subject of this analysis, thus it will not be challenged as it regards its lawfulness. Following the adoption of the first resolution, the case was disjoined concerning offences of abuse of office, the last five resolutions being given subsequently after the disjoint.

With regard to these five resolutions, among others, the defense attorney revealed that they are null and void; subsequently the warrants that were issued based on them are null. These aspects were invoked during preliminary chamber procedure considering that the judicial control over the ruling of authorization for technical surveillance measures given by the judge of rights and freedoms, although it`s definitive character, falls in the competence of the preliminary chamber judge.

2. The defendant claims and exceptions

The defense claimed that the decisions are unlawful and unfounded, leading to the conclusion that there is a lack of motivation itself given that all magistrates had in mind the offenses retained in the first resolution. Magistrates gave interception warrants for offenses of traffic of influence, buying of influence and aiding and abetting instead for abuse of office.

None of these decisions is motivated, the analysis of the legal requirements regarding the necessity, proportionality and subsidiarity of technical surveillance measures being made in relation to the offenses of trading in influence, buying influence and aiding and abetting, thus regarding other facts than those for which it has been open the criminal investigation in the new drafted case.

Also there has been stated that the harm is evident in such circumstances that the intrusion into

private life occurred without a thorough analysis from the authorized judge, it was an abuse which flagrantly broke European and national laws and violated the private life of the persons subjected to surveillance. In reference to these aspects it was detailed, concerning each of the five resolutions of the judges of rights and liberties, arguing on the reasons for nullities of the mentioned rulings, stating that in all five cases the judgment does not match the content of the resolution, thus violating the rights of defendants who had been intercepted on the basis of warrants obtained pursuant to unlawful rulings.

The defense pointed out that the errors committed by the judge of rights and freedoms should be punished at this time, otherwise the ECHR will have to condemn Romania again.

Relative to the subsidiarity of this measure, the judge of rights and freedoms motivates based on other allegations and extended the first warrants for crimes of trading in influence, buying of influence and aiding and abetting. The motivations relate to other cases and it becomes evident that no judge has read the file, the judges have collectively referred to the first warrant and hence the injury, or if it were to be known the offenses for which the defendant was investigated probably no judge would have admitted the prosecution request.

Defender requests the sanction of these serious misconducts that led to violation of article 8 of the ECHR and at rights infringements procedure. The proposals were admitted in bulk and motivation did not regard each person individually, with a minimum motivation.

The claims and exceptions submitted by the defense for the defendant were communicated to the NAD in order to formulate an answer. Along with the reply on exceptions, NAD representatives have filed five resolutions given by the same judges of rights and freedoms for correcting the errors.

3. National Anticorruption Division`s Response Regarding the Defense Claims

Regarding the issues raised at pt. 1, from an analysis of the five court resolutions issued by the Bucharest County Court, it appears that the judges of rights and freedoms that authorized the technical surveillance measures have considered the factual situation of the offenses related to the case, they analyzed the evidentiary means which resulted from implementing the technical surveillance warrants, they explored whether the criminal investigation was initiated, they analyzed the cumulative conditions provided by article 139 par. 2 of the Criminal Procedure Code, the proportionality and the necessity in order to authorize the technical surveillance measures.

Indeed, although it was mentioned, in all five court resolutions that it is the opinion of the prosecutor's office that there are reasonable suspicion about committing the offences of abuse of office, if the civil servant obtained for himself or for others an unlawful advantage incriminated and punished in article 132 of Law no. 78/2000 on preventing, discovering and sanctioning corruption offences, referring to article 297 of the Criminal Code, instigation to abuse of office, instigation to use, in any way, directly or indirectly, information which is not public or allowing unauthorized persons to access this information, offence punished by article 47 in reference to article 12 letter b) of Law no. 78/2000 and use, in any way, directly or indirectly, information which is not public or allowing unauthorized persons to access this information, crime punished by article 12 letter b) of Law no. 78/2000, although the conditions stipulated by art. 139 of the Criminal Procedure Code were analyzed in regard to these offenses, because of a material error in the analysis part of the resolution, the existence of a reasonable suspicion on preparing or committing other offenses, respectively traffic of influence, buying influence and favoring the offender, offenses which were the subject of prosecution in the criminal case from which present case was disjointed, was mentioned.

We consider that in order to assess whether the provisions of article 139 of the Criminal Procedure Code were complied with, during the procedure of extending the warrants for technical surveillance measures, all five court resolutions must be analyzed in their entirety and not individually.

The mention of other articles in the content of the resolutions, regarding other offences than the ones against which was retained the reasonable suspicion of committing, is just a material error simply

because the factual situation regards crimes related to the present case, given the fact that the analysis, of the necessary conditions for extending the warrants for technical surveillance measures, was conducted in its entirety.

For these reasons, based on article 278 of the Criminal Procedure Code, it was requested that judges of rights and freedoms, who issued the resolutions, correct the material errors.

In conclusion, we consider that the surveillance measures were requested and extended lawfully, reason why the exclusion of evidence obtained by conducting technical surveillance measures, is not mandatory.

4. Clarifications of the Defense`s Arguments Submitted in Court

Given the procedural rules stated by the Criminal Procedure Code and in respect of the response submitted by the NAD, the defense submitted a series of new arguments in regard of these new acts, pointing out that:

1. The errors in technical surveillance measure authorization are errors of judgment and not at all material errors.

2. The resolution of the correcting the material errors are not res judicata.

3. The illegality of the technical surveillance measure authorization and of the resolution for correcting material errors is subject to censorship of a preliminary chamber judge.

New resolutions pronounced by judges of rights and freedoms within the Bucharest County Court cannot be regarded as rulings for the correcting of some material errors.

Material errors are those errors slipped on the occasion of the drafting of a document and does not affect the validity or merits of the judgment. In this context, we cannot consider that a lack of motivation or reasoning based on other circumstances or facts that has not been retained by the prosecutor in the indictment, can be "corrected" in accordance with the procedure for correcting of material errors.

This is the practice of the Supreme Court, in which it repeatedly emphasized the distinction between material error and error of judgment:

"To such mistakes which are not able to affect the actual substance of the decision, it cannot be assimilated the failure to state reasons of the decision, so that this lack could be covered by the procedure laid down by article 281 of the Civil Procedure Code.

In doing so, the court violated the principle of the divestiture, which assumes that after the solution is adopted we can no longer go back on it including any additional arguments or actual reasons for that the judicial power was exhausted.

Lack of reasoning of the decision itself cannot be supplemented by subsequent delivery of a ruling of correction of error, with the justification that the mistake was determined by how the decision was drafted".[1]

In another case, the Supreme Court expressly stated that:*"To be subject to the procedure for correcting, the errors must be obvious and material. Constitute obvious factual error only those script mistakes, in the case of writing the name or surname of a person, of an amount, of some dates referred to in the procedural act or the date of drawing up the act, obvious error being translated in the absence of any doubt about the certainty that they are manifest, and not subject to further deliberation, appreciation or expressing a belief "*.[2]

So, it is obvious that the resolution of correcting material errors are the result of a new deliberation and reassessment of situation originally intended by judge of rights and freedoms at the time of

approval of technical surveillance measure, aspect that is unacceptable to be achieved by means of correcting material errors. The legislator has not provided a procedure for a court judgment self-correcting errors, because in such a situation he would have not regulated the appeal procedures or the judicial review.

There may not be considered material errors full pages of the authorization for technical surveillance measures that were given in the first place considering other facts than those for which a person is prosecuted.

2. We demonstrate that the resolutions of correcting material errors are not res judicata and, consequently, preliminary chamber judge is not bound of their contents.

In this regard, the supreme court of Romania revealed that: *"the resolution for correcting material errors or those given to remove obvious omissions cannot be appealed separately but only with judgment itself, the appeal against the sentence reckoning that is made against these decisions as well, even if they were given after the judgment"*.[3]

Considering that the resolutions for correcting material errors are part of the authorization of technical surveillance measures, it becomes obvious that they are subject to the preliminary chamber judicial review, especially in the context in which the authorization for technical surveillance measures are not subject to any judicial remedy, the legislator foreseeing the possibility of controlling them in the preliminary chamber.

To consider at this moment that through the procedure for correcting material errors is possible to elude from the examination, conducted by a preliminary chamber judge, the technical surveillance authorizations, leads to deprivation of the legal content of the object of preliminary ruling chamber itself.

The more so corrected or not, the authorizations had illegal effects on a person's privacy.

In the context in which the judge of rights and freedoms who acquiesced surveillance measures might have wanted to self-correct by the procedure of article 278 of the Criminal Procedure Code, he could have done that no later than the deadline for which the warrant for technical surveillance measures was issued.

The damage is obvious considering that if investigating judges of rights and freedoms might have taken into consideration in their reasoning the crimes of the prosecution, they might not acquiesced the prosecutor demands or they would just have acquiesced partially.

Preliminary Chamber judge has the duty to sanction the wrongdoing in the authorization by annulling their contents.

Pursuant to article 282 of the Criminal Procedure Code, we requested the annulment of the authorizations, considering that the conditions which attract the relative nullity are met. Thus, given the considerations elaborated in detail, we required to take into consideration that even at this time, although the judges of the Bucharest County Court pronounced resolutions for correcting material errors, they are not able to cover the grounds for revocation that we invoked.

It is generally accepted that rulings for correcting material error do not have an independent existence but are an integral part of the conclusion that it corrects.

So, given that the ruling for authorization of technical surveillance measures, by law, are not likely to be appealed, we believe that the only judicial body, empowered to sanction their illegality and groundlessness is the preliminary chamber judge.

Incidentally, this is the optics of the national courts which noted that: *"Within the procedure of the preliminary chamber is checked retrospectively the lawfulness of both the indictment and the evidence on which it is based, so that the entire phase of the prosecution to be examined and*

researched and the procedural acts, procedures, evidence or evidentiary methods carried out or obtained in breach of equitability of the procedures to be removed".[4]

5. The Court's Judgment

The preliminary chamber judge, in regard of these aspects shall withhold that claims brought have the character of an appeal against definitive rulings pronounced by the judges of the rights and freedoms, rulings that have authorized a part of the wiretaps in the case. An initial issue concerns the fact that, under the procedural aspect, these rulings cannot be discussed in terms of their legality in the procedure of preliminary chamber and the judge cannot rule on their legality given that he could not exercise the role of a judicial reviewer, but only to filter concerning matters of legality exclusively on the prosecutor's acts.

The purpose of the preliminary chamber is to verify the legality of prosecutor`s acts and not to discuss the legality of the definitive rulings given by the judge of rights and freedoms. If the legislator had considered it necessary he would have included an appeal against this kind of rulings, but at this particular moment, according to the criminal procedure code they are definitive.

Moreover, even if we could talk on the legality, along with the response to exceptions, representatives of NAD submitted five resolutions given by judges of rights and freedom for correcting the obvious material error, stating that the rulings must be examined as a whole and not done separately.

It has also been shown by the defense counsel that the resolutions for correcting material error are not legal, since this type of changes could not be made within this procedure. But as stated before, it is about definitive rulings given by a judge of rights and freedoms that are not covered by the procedure of preliminary chamber.

The provisions of article 342 Criminal Procedure Code state about the checking of the competence and legality of the indictment, the verification of the legality of evidence and of their conduct by the prosecution. Besides, the aforementioned provisions are complemented by art. 54 Criminal Procedure Code, which establishes the competence of the judge in the preliminary chamber: verify the legality of prosecuting, check the legality of evidence and the conduct of procedural acts by the prosecution, resolves complaints against the solutions for non-prosecution or not to indict and solves other situations expressly provided by law.

Thus, the limits of the competence of a judge in preliminary chamber are expressly and exhaustively set out and the verification of the lawfulness of rulings, by which were ordered the extensions of authorizations of technical surveillance measures, in this case, exceed these powers.

6. Critics Regarding the Ruling of the Preliminary Chamber Judge

Aspects concerning the unlawfulness of rulings by which were authorized or assented specific probative procedures have been considered by the legislator of the new Criminal Procedure Code ever since the earlier phase of entering into force.

Thus, through the Explanatory Memorandum of Law no. 255/2013 for the implementation of the Criminal Procedure Code, the procedural penalties for unlawfully obtained evidence have been reconsidered.

The legislator highlighted that: "there were revalued the texts on sanctions applicable to the procedural evidence administrated unlawfully. The debates with magistrates, judges and prosecutors, made obvious the interpretable character of the original text (art. 102), capable of creating non-uniform practice regarding the significance or consequences of the illegality of certain evidences. Thus, into the texts with principle value on the loyalty of evidence, the exclusion of evidence unlawfully administrated and evidence derived there from, it was stated explicitly on the relationship between the evidence, on the one hand, and on the ruling that ordained or authorized its

administration, the evidentiary means and methods, on the other hand, expressly providing for the invalidity of the latter attracts the exclusion of the evidence".[5]

We observe that the violation of the provisions on carrying out and exploitation of data derived from the surveillance measures are sanctioned by the legislator in the Preliminary Chamber, which, by its rules, eliminate the possibility of restitution, subsequently in the trial stage, of the case to the prosecution by analyzing at the same time, previously to sending to the court, the lawfulness of evidences from this phase and if the rules were respected regarding the procedure for issuing the warrant for technical surveillance measures and the enforcement thereof. (Gradinaru S., 2015, p. 187)

The relevant doctrine (Udroiu M. 2014, p. 659), states that from art. 102 par. 3 of the Criminal Procedure Code results that exclusion of evidence unlawfully or unfairly administrated is not an autonomous procedural sanction, but subsumed under the penalty of invalidity intervened only to the extent it has been ascertained the nullity (absolute or relative) of the ruling that ordained or authorized the evidentiary method or by which it was administered.

"The ruling by which the judge of rights and freedoms authorized technical surveillance measures cannot not be appealed irrespective of the decision in matter; nevertheless, we appreciate that falls within the competence of the preliminary chamber judge the analysis of the legality of the ruling through which the judge of rights and freedoms authorized technical surveillance measures or the means of evidence obtained through the acquiesced evidentiary process (for example, one can ascertain the nullity of the acquiesced evidentiary process by a judge of rights and freedom in breach of the rules of personal or material competence). (Udroiu M. 2015, p. 356)

Another author (Tudoran M. V., 2012, pp. 126-130) has attempted to emphasize the situations in which the nullity of the authorization may be invoked, retaining the following situation relevant in the present case:

“The authorization does not include the mentions stipulated by law. When referring to the term "mentions" that includes the obligation to motivate the ruling of the judge, as long as all categories of procedural acts in this matter must include an actually motivation for the corresponding request”.

Whether nevertheless it was started the enforcement of the warrant, even vitiated, considering the elements required, but not included in the emitted authorization, we appreciate that in this situation of manifest illegality, the authorization and all technical surveillance measures performed will be excluded from the case, given the finding of absolute nullity of that act. The court has the possibility to take ex officio into consideration that violation of the rights of the monitored person, basically without lawfully emitted authorization, in this situation the annulment of the act being necessary in order to discover the truth and fair settlement of the case.

To this extent, national courts have ruled that: *"in order to rule in this manner, the preliminary chamber judge, when examining the request for the declaration of absolute nullity of Criminal ruling no. 29/ I/09.22.2014 of the judge of rights and freedoms of the District Court Z. and exclusion of evidence, formulated in terms of article 345 par. (1) of the Criminal Procedure Code, he found that they are unfounded, according to article 141.*

Therefore, finding the lawfulness and merits of the Criminal ruling no. 29/I/09.22.2014 given by the judge of rights and freedoms of the District Court Z., the preliminary chamber judge has rejected the nullity of this decision and the exclusion of any evidence obtained as a result of temporary authorization of the use of technical surveillance measures, namely the interception and recording of calls made from phone with no …., station belonging to the defendant". [6]

7.Conclusions

In the procedure of preliminary chamber, is carried out an *a posteriori* judicial control of the lawfulness of both the indictment and the evidence on which it is based, so that the whole phase of

the criminal prosecution to be examined and researched and trial documents, procedural acts, evidence or probative procedures performed or obtained in breach of equity to be removed.

Considering the procedural stage, for analysis of the entire criminal investigation, the ruling by which technical surveillance measures are authorized, as part of the evidentiary ensemble, may be assessed as for their legality, proportionality and subsidiarity, by the judge of the preliminary chamber .

To consider at this moment that through the procedure for correcting material errors is possible to evade authorizations from the examination conducted by the judge of preliminary chamber leads to deprivation of content of the object of preliminary chamber itself.

Thereby, considering that the exclusion of evidence is a sanction that might be applied by the judge of the preliminary chamber, according to the above reasoning, can be ascertained inclusively the nullity of the ruling by which has been duly authorized the evidentiary method. In other words, preliminary chamber judge can ascertain the nullity of the ruling given by a judge of rights and freedoms by which it authorized conducting technical supervision measures.

Abstract

Utterance segmentation is an important task in conversational analysis process. It consists mainly on dividing discussions into functional segments that would be labelled with the corresponding dialogue acts. In this paper, we proposed a novel discriminative method based on Conditional Random Fields to automatically extract utterance boundaries within Arabic politic debates taken from Aljazeera broadcasts. Despite of the complexity of the used corpus that includes long utterances expressing opinions conflicts and arguments, learning results were very encouraging with a relevant f-score of 97.3%.

Keywords: utterance segmentation, turn segmentation, Arabic debates, CRF classifier.

Introduction

The segmentation task is a primordial step in human-human conversational analysis. In fact, conversation segmentation differs from traditional text segmentation. It consists of dividing conversation into turns; each turn is then segmented into meaningful units named utterances. Utterances have approximately similar boundaries to the annotated dialogue acts units.
Utterance segmentation can be supported by several higher-level tasks such as dialogue acts recognition, question/answer, information retrieval and conversations summarization. Our work involves as a first step the segmentation of politic debates into utterances that can be labeled with the following dialogue acts in the annotation task. Typical dialogue acts types are requests, opinions, acceptations, rejects and arguments tags.
The motivation of dialogue act recognition framework is to build argumentative structures like “thesis/ opinion request/ opinion”, “opinion/Accept/Justification” dialogue acts sequences. These communicative chains endorse participants’ interaction and conflicts that occur frequently in politic debates. Argumentative sequences can be useful to reply to complex questions such as “Who rejected the opinion of X concerning the idea Y?”.
This paper is structured in two main sections. First, we present previous works in automatic segmentation task. Then, we detail segmentation experiments and results using conditional random fields applied on a set of Arabic politic debates collected from Aljazeera TV programs.

1. Related work

The problem of identifying the different DA segments within an utterance has been addressed with generative or discriminative approaches.

The most popular generative model is the hidden event language model, as introduced by Stolcke and Shriberg (1996). In this approach, sentence boundaries are treated as the hidden events, and the above optimization is simply done by the Viterbi decoding.

Ivanovic (2005) applied also generative approaches more precisely Hidden Markov Models (HMM) to find the most likely segment boundaries in online instant messages based services. They build two probability distributions representing the probability that a token is at the state of beginning of a segment or not, respectively. They experiment HMM approach based on sequences of lemmas, part

of speech tags, and head words of chunks. They also explored a syntactic method based on parse trees as they assume that utterance boundaries only occur at major syntactic boundaries. Best results are obtained with the parse tree method.

Geertzen et al. (2007) applied graphical models to automatically detect functional segments. They experiment Naïve Bayes generative classifier with the DIAMOND corpus consisting of assistance-seeking Dutch dialogues. They explored features relating to dialogue history, prosody and word occurrence.

Lafferty et al. (2001) introduced CRFs as discriminative models that have been proposed to perform better than HMMs and maximum entropy approaches for the task of utterance segmentation. In this context, Silvia et al. (2011) experiments CRFs using n-grams of words and POS tags with a context window of -2/+2. Experiments were lead using two corpora namely SWITCHBOARD and LUNA corpus.

Guz et al. (2010) applied semi-supervised learning method given the hard task of annotation and the high cost of human experts to manually label training data. Thus, the goal of semi-supervised learning is to reduce the amount of labeled data needed to train statistical models. Guz et al. (2010) applied self-training and co-training approaches using the ICSI meeting corpus of multichannel conversational speech data proposed by Shriberg et al. (2004).

Most of utterance segmentation researches were applied on various languages corpora like English, German and Italian. Researches on Arabic conversation classification (Bahou et al. (2008), Shala et al. (2010), Graja et al. (2013), Lhioui et al. (2013), Hijjawi et al. (2013)) consider a turn as one utterance; so utterance segmentation returns to turn segmentation task. To the best of our knowledge, the only work that segment Arabic dialogues turns into utterances is implemented by Elmadany et al. (2005) who proposed an automatic segmentation utterance approach using SVM classifier for Egyptian instant messages. They used the JANA corpus which consists of approximately 3001 turns, 4725 utterances with average 4.3 words per utterance, and 20311 words. They explored lexical and morpho-syntactic features for boundaries detection. They obtained an F_1 score of 90.75%.

Compared to the last research implemented for Arabic turn segmentation into utterances, our work shows best reliability in terms of corpus size (about 100 thousand words) and evaluation results (F_1 score=97.4%) despite of the complexity of delimiting politic debates that generally include segments with an important number of words in each utterance (it can reach 50 words per utterance). The complexity is also due to the difficulty of detecting boundaries mainly for argumentative acts as when enunciating a personal opinion or when enumerating arguments.

2. Methodology

Debates segmentation consists mainly of three steps: preprocessing, turn and utterance segmentation subtasks.

2.1. Preprocessing

As a first step before training the collected data, we perform the preprocessing task which consists of three main steps:

a) Save information in the head of each conversation (program name, episode title, date, topics discussed, participants …). Mostly, politic debates have the following head structure as detailed in figure 1.

```
<head>
  <program_name>ما وراء الخبر</program_name>
  <episode_name>الحوار الوطني التونسي والخيارات المتاحة</episode_name>
  <animator>محمد كريشان</animator>
  <participants>
```

```
    <participant id="0">رضا بوزريبة</participant>
    <participant id="1">رفيق عبد السلام</participant>
  </participants>
  <date>2013/10/4</date>
  <subtopics>
    <subtopic id="0">خارج ورقة الرباعي</subtopic>
    <subtopic id="1">خوف على الحوار</subtopic>
    <subtopic id="2">إطار لعقد الصفقات</subtopic>
    <subtopic id="3">الوضع الاقتصادي والوضع الأمني</subtopic>
  </subtopics>
</head>
```

Fig 1. Example of a debate head

b) Manually translate ambiguous words to Modern Standard Arabic (MSA), the case of dialectal expressions and words from other languages used in oral conversations. Examples of ambiguous words are illustrated in table 1.

Table 1: Examples of translated segments to MSA.

Original segment	*Translated segment*
Segment in strange language (English) ***Ok**, **no problem**.*	***طيب**، **ليس هناك مشكل**.*
Dialectal Segment (Tunisian Dialect) ***ايه**، أنا **نشوف اللي** تونس **تنجم توا** تبني علاقات دبلوماسية جديدة.*	**نعم** ، أنا أرى أن تونس **تستطيع في الوقت الحاضر** أن تبني علاقات دبلوماسية جديدة.

c) Extend words with some characteristics like Backwalter transliteration[1], lemma and POS tag using MADAMIRA tool implemented by Pasha et al. (2014).

An excerpt of the preprocessed data set is detailed in figure 2.

```
<w id="1" word=" AlslAm " lemma="سلام" pos="noun" >السلام</w>
<w id="2" word=" Elykm " lemma="علي" pos="prep" >عليكم</w>
<w id="3" word=" wrHmp" lemma="رحمة" pos="noun" >ورحمة</w>
<w id="4" word=" Allh" lemma="الله" pos="noun_prop" >الله </w>
<w id="5" word=" w>hlA" lemma="أهل" pos="adj" >وأهلا</w>
<w id="6" word=" bkm" lemma="ب" pos="prep">بكم</w>
<w id="7" word=" fy" lemma="في" pos="prep" >في</w>
<w id="8" word=" brnAmj" lemma="برنامج" pos="noun" >برنامج</w>
<w id="9" word=" Hdyv" lemma="حديث" pos="noun" >حديث</w>
<w id="10" word="Alvwrp" lemma="ثورة" pos="noun" >الثورة</w>
```

Fig 2. Excerpt of preprocessed training data

2.2. Turn segmentation

Given that each turn is enunciated by a speaker, turn segmentation consists of decomposing the discussion into turns according to speaker change. Generally, turns starts with the speaker name followed by the punctuation mark ":". An example of segmented turns is presented in the figure 3.

```
<turn speaker ="الحبيب الغريبي" id_turn ="20">

أهلاً بكم من جديد في هذه الحلقة التي تناقش دلالات قيام رئيس الحكومة التونسية مهدي جمعة بأولى زياراته الخارجية إلى الجزائر، سيد ضيف الله هل نعتبر أن تونس
الآن في مرحلة إعادة ترتيب أولويات سياستها الخارجية وإعادة صياغة مواقفها وربما ترميم بعض الشروخ التي ظهرت في سياساتها الدبلوماسية في الفترة الأخيرة؟

</turn>
```

[1] http://www.qamus.org/transliteration.htm

```
<turn Speaker="محمد ضيف الله" id_turn="21">

نعم أرى أن تونس تستطيع في الوقت الحاضر أن تبني علاقات دبلوماسية جديدة أعتقد أن هذا التكثيف أتى ربما على حساب أو بالموازاة مع العلاقة التونسية مع بلدان
أوروبية أساساً كانت لها علاقات وثيقة مع النظام السابق مثل إيطاليا وخاصة فرنسا، فتوطيد العلاقات مع الجزائر هو نوع من إيجاد توازن أمام تلك القوى وأعتقد أن
زيارة الغنوشي تتأطر في هذا الإطار خاصة وأن العلاقات مع بقية البلدان العربية كما قلت في البداية.

</turn>
```

Fig 3. Turn segmentation example

2.3. Utterance segmentation

Turns can be formed by one or more utterances. Most researches consider that a turn matches a simple utterance. In our work, politic debates are consisted of long turns that expose ideas, opinions and arguments. So, turns are likely consisted of more than one utterance. Each segmented utterance is then annotated with the following dialogue act. In this purpose, it is important to identify the right segment delimiters to get better annotation results.
To automatically define utterances boundaries, we applied the probabilistic CRF (Conditional Random Fields) learner introduced by Lafferty et al. (2001). This classifier is frequently used for labeling and segmenting sequential data.

2.3.1. Conditional Random Fields

CRFs are undirected graphical models used to specify the conditional probability of assigning output labels given a set of input observations. A conditional probability distribution is defined over label sequences given a particular observation sequence.

CRFs model the conditional distribution P(Y|X), X is an input sequence of observed variables and Y represents a hidden state variable that needs to be inferred given the observation X. In our context, X is considered as a sequence of features for each word and Y the predicted class following the IOB notation model in which every word is to be tagged with one of these two labels: “B” for the first word of a segment and “I” for non initial word belonging to a segment.

The advantage of CRFs compared to conventional classification models is that it takes into consideration dependencies between interconnected annotations in the graph. CRF was experimented for Arabic language in text chunking task by Khoufi et al. (2014) and Khoufi et al. (2015). It was also used in dialogue annotation task by Graja et al. (2013). Obtained results were very encouraging confirming the high accuracy of this classifier in labeling sequential data.

2.3.2. Data Set

To train data with learning machine classifiers, we need a large set of human conversations manually segmented into utterances. Thus, we collected politic debates from Aljazeera TV broadcasts[2] dealing with topical themes (Tunisian revolution, Syrian war, Tunisian elections, etc). The training data was manually segmented by human experts using the ActAAr tool (**Act A**nnotation in **Ar**abic) implemented by BenDbabis et al. (2012). The collected data named CARD corpus (**C**orpus of **AR**abic **D**ebates) was also used by BenDbabis et al. (2015) in the dialogue acts annotation task. Basic information of the collected corpus are detailed in the table below:

Table 1: CARD 1.1 Corpus statistics

Total number of conversations	22
Total number of words	101169
Total number of turns	1805
Total number of utterances	6050
Average number of turns/conversation	82
Average number of utterances/conversation	275

[2] www.Aljazeera.net

Average number of words/conversation	4599
Average number of words/utterance	16
Average number of utterances/turn	3
Average number of participants/conversation	6

2.3.3. Feature extraction

Defining features is the most important process for machine learning approaches as it greatly affects the labeling performance. In our work we chose lexical features like cue words, question words and punctuation marks as they strongly define segments limits. We also explore morpho-syntactic feature namely the Part Of Speech (POS) of words. For each word and the following feature, we used a context window of +2/-2, that means we take into account the two previous and the two next words and their corresponding features values.

- *Punctuation.* Punctuation marks are strong indicators of utterance delimiters particularly for defining ends of segments. For instance, question marks are mostly present at the end of a question.

- *Question words.* These words indicate strongly if the speaker is asking a question or requiring a specific kind of request. They generally occur at the beginning of a segment. For example the word "how" "كيف" generally introduces an utterance that expresses an explanation request.

- *Cue words.* The most common key words or expressions can serve as useful indicators of Dialogue Acts segmentation. These cue phrases are words or groups of words that appear mostly at the beginning of an utterance. Cue phrases occurred frequently as unigrams ("ok" "طبعا" , "yes" "نعم", "I think" "أعتقد", "I agree" "أوافق") or bigrams ("of course" "بطبيعة الحال", "good evening" "مساء الخير").

- *POS tags.* At this level, we used the MADAMIRA morphological analyzer. This tool can be used for several NLP tasks as tokenization, lemmatization, morphological and syntactic analysis. In our work, we performed MADAMIRA to extract word lemmas and POS tags (verb, noun, adjective, adverb, etc). This analyzer shows high reliability in Arabic processing tasks as it performs data disambiguation.

2.4. Experiments and Results

For learning process, we divided the CARD corpus into two parts: 80% for training (79 493 words) and 20% for test (22 089 words). We used the CRF++ platform to train and test the model. This tool is an implementation of CRFs for labeling sequential data.

To train the CARD data, we defined a template that includes unigrams and bigrams of features to focus on the dependencies between features. For each feature, we take into account the two previous and next words (context window=2). The train data and the proposed template were then used by CRF++ classifier in order to generate a prediction model which will be used to segment any new conversation.

Boundary detection performance is evaluated using the known metrics as recall, precision and fscore. We have also adopted evaluation measures specific to the segmentation task used by Zimmermann (2005) namely DA Segmentation Error Rate (DSER). The DSER measures the percentage of wrongly segmented DA segments, where a DA is considered to be mis-segmented if and only if its left or right boundary (or both) does not exactly correspond to the reference segmentation.

To better evaluate CRF performance, we compared the obtained results to the following classifiers: Naïve Bayes (NB), Decision tree (J48) and SMO learning algorithms. Comparison results are shown in table 3.

Table 3: Evaluation results

	NB	J48	SMO	CRF
Recall	0,94	0,94	0,94	0,974
Precision	0,92	0,89	0,93	0,972
F-measure	0,92	0,91	0,92	0,973
DSER	0,06	0,059	0,058	0,026

Results show the efficiency of CRF model in segmenting sequential data with a reduced error rate (DSER=2,59%) compared to other classifiers. Including dependencies about previous and next word features is benefic for the segmentation task. We can notice that lexical cue words are generally used at the beginning of segments.

Punctuation marks are mostly strong indicators of the limit of a segment. Nevertheless, punctuation can cause wrong boundaries especially when the speaker presents an idea or opinion that needs more one sentence. Segmentation errors can be also due to the fact that cue words and question words can occur inside a segment.

The segmentation results are highly reliable compared to the complexity of the corpus especially when presenting argumentative segments.

3. Conclusion and Future Work

In this paper, we proposed an automatic dialogue act segmentation method for Arabic argumentative debates. We experimented CRF algorithm to perform the segmentation process including lexical and morpho-syntactic features.
We obtained high satisfying results with a precision score of = 97,4%, a recall value of 97,2% and an f-score equal to 97,3%.
As a future work, we intend to introduce the segmented utterances, output of the automatic segmentation process, as an input for the automatic annotation task. We also intend to extend the training corpora to improve machine learning results.

Résumé

Etant une forme de communication tout à fait spontanée et non commerciale, le bouche-à-oreille (BAO) fait croire au consommateur que le message transmis par les autres est plus fiable que celui émis par l'entreprise et oriente l'individu dans son processus décisionnel. Internet a donné un nouvel aspect au BAO en facilitant le passage d'information entre des individus qui ne se connaissent pas. Avec une vitesse de diffusion nettement supérieure à celle du BAO traditionnel et un partage illimité dans le temps et dans l'espace, le BAO électronique exerce un pouvoir d'influence important sur les consommateurs et leur processus décisionnel. Un BAO électronique négatif pourrait pousser le consommateur à boycotter certaines marques, produits ou entreprises. La perception du message partagé par les autres sur Internet change d'un individu à un autre et pourrait bien dépendre de variables culturelles. L'objectif de ce travail de recherche est d'explorer le rôle joué par la culture dans la détermination du boycott suite à un BAO électronique négatif. Une méthodologie de recherche qualitative basée sur une netnographie et des réunions de groupe thématiques a été adoptée. Les résultats mettent en avant le rôle que jouent les variables culturelles telles que dans la perception du message ayant créé un BAO électronique, dans son interprétation et dans les futures réactions des consommateurs.

Mots clés : BAO électronique négatif, boycott, variables culturelles

Abstract

Consumers use to trust others' opinions than those of commercials. Word-of-mouth (WOM) can determine consumers' decision-making process. Internet gave a new facet to WOM, individuals can easily and quickly share information with persons that they didn't know before. With a speeder diffusion rate than traditional WOM, and an unlimited access to information, eWOM affects considerably consumers and their decision-making process. A negative eWOM can push consumers boycott brands, products or firms. The online shared message is perceived differently from a person

to another depending on cultural variables. The objective of this research paper is to explore the role of culture in determining boycott behavior after a negative eWOM. A qualitative research methodology was adopted based on netnography and thematic focus groups. The results highlight the role played by cultural variables in determining consumers' perception of eWOM, the interpretation of these messages and their future reactions.

Keywords: Negative eWOM, boycott, cultural variables

1. Introduction

« *Tout groupe humain prend sa richesse de la communication* » (Françoise Dolto : 1908-1988). Communiquer, partager ses avis, ses sentiments et ses opinions avec les autres est un acte tout à fait naturel et spontané pour l'Homme. Ce partage prend sa richesse du pouvoir d'influence accordé à l'émetteur du message. Le pouvoir de ce partage s'accroît avec la possibilité de transmission du message accordée à son récepteur : il s'agit du bouche-à-oreille (BAO). Etant une forme de communication tout à fait spontanée et pas commerciale (Lindgreen et Vanhamme, 2005), le BAO oriente l'individu dans son processus décisionnel (Hawkins *et al.,* 2004). Internet a donné un nouvel aspect au BAO en facilitant le passage d'information entre des individus qui ne se connaissent pas. Avec une vitesse de diffusion nettement supérieure à celle du BAO traditionnel et un partage illimité dans le temps et dans l'espace, le BAO électronique exerce un pouvoir d'influence important sur les consommateurs et leur processus décisionnel (Cheung et Thadani, 2010 ; Kelley et Marx, 2011 ; Robinson *et al.,* 2012 ; Charo *et al*., 2015). Les consommateurs achètent en fonction de l'information disponible en ligne (Lee *et al.,* 2007). Les avis, les expériences et les sentiments partagés par les autres exercent une forte influence sur son intention d'achat (Pollach, 2008).

Lorsqu'il est négatif, le BAO électronique pourrait avoir de graves conséquences sur l'entreprise (Armelini et Vilanueva, 2011). Une des conséquences négatives les plus directes du BAO négatif : le boycott, lorsque les consommateurs se décident à ne plus acquérir les produits de l'entreprise. Quelle que soit la motivation du boycott, le point de départ pourrait être un simple message partagé sur Internet. Ce message négatif émane généralement d'un consommateur ayant vécu une expérience négative avec un produit, une marque ou une entreprise. La vitesse de diffusion de ce message engendre, chez le consommateur, un altruisme et une volonté d'éviter la reproduction de cette expérience au point de partager, à son tour, l'information avec d'autres individus. Cet effet « boule de neige » ne peut qu'affecter l'image de l'entreprise (Reynolds, 2006) voire ses futures ventes (Griffith, 2011 ; Charo *et al*., 2015). Seulement la manière avec laquelle l'individu perçoit un message négatif varie d'une personne à une autre et en fonction de plusieurs facteurs. En effet, étant exposé à un même message, deux individus pourraient bien réagir différemment. Le rôle de la culture dans la communication interpersonnelle est pertinent (Hall, 1976). La culture exerce une influence sur l'adoption du BAO (Lam *et al*., 2009). Il est alors possible que la culture affecte la perception d'un message partagé et transmis sur Internet et l'effet du BAO négatif sur l'intention de boycott des produits de l'entreprise. Seulement de nombreuses recherches ont été dédiées à l'étude du BAO électronique et ses répercussions sur l'entreprise (Bickart et Schindler, 2001; Doh et Hwang, 2009; Huang *et al*., 2009; Park et Lee, 2009; Park et Kim, 2008; Sher et Lee, 2009; Xia et Bechwati 2008; Park *et al*., 2007 ; Lee et Lee, 2009 ; Kelley, 2011 ; Almana et Mirza, 2013 ; Charo *et al*., 2015), mais il n'existe pas, à notre connaissance, de recherches impliquant les variables culturelles dans la détermination du boycott suite à un BAO électronique négatif. L'objectif de ce travail de recherche est alors d'explorer le rôle que pourrait jouer la culture dans la perception d'un message négatif transmis sur Internet et ses répercussions sur l'intention de boycott.

2. Revue de la Littérature

2.1 Le bouche-à-oreille électronique

Les recherches sur le bouche-à-oreille (BAO) datent des années 60' (Arndt 1967; Dichter 1966; Engel *et al.,* 1969). Le BAO a été défini de plusieurs manières. Parmi les premières définitions données au BAO, nous pouvons en souligner une, celle de Arndt (1967) et qui était l'un des pionniers à l'avoir défini. Cette définition considère le BAO comme étant la communication sur les produits ou

les entreprises entre des personnes que l'entreprise n'a pas engagées (Arndt, 1967). Etant une communication informelle, les individus trouvent que la source du message est parfaitement indépendante de toute intention commerciale, l'entreprise n'est pas à l'origine de l'information partagée par les individus, ce qui fait la différence entre le BAO et le marketing viral (Lindgreen et Vanhamme, 2005). Son caractère spontané lui accorde tout son pouvoir d'influence sur le consommateur. Ce dernier considère les propos des autres plus crédibles que ceux partagés par l'entreprise (Armelini et Vilanueva., 2011). Le BAO donne la possibilité aux consommateurs de partager librement leurs opinions et les oriente dans leurs futures décisions (Hawkins *et al.,* 2004). Les théories traditionnelles de la communication supposent l'existence de quatre principaux éléments constitutifs de la communication sociale : l'émetteur du message, le simulus (le message), le récepteur du message et la réponse (Hovland, 1948).

Avec la naissance d'Internet et sa démocratisation, l'influence des consommateurs les uns sur les autres via le BAO s'est clairement accélérée (Cheung et Thadani, 2010). En effet, la technologie a donné plus de pouvoir à la parole du consommateur et a, de ce fait, rendu le BAO plus persuasif (Litvin *et al.,* 2008). Le BAO électronique se réfère à tout propos, positif ou négatif, émis par les consommateurs concernant un produit ou une entreprise sur Internet (Hennig-Turau *et al.,* 2004).

L'information partagée dans le cadre d'un BAO électronique se caractérise, par rapport au BAO traditionnel, par une vitesse de diffusion bien plus rapide. Cette diffusion se réalise, lorsqu'elle est électronique, de multiples manières : forums et groupes de discussions, blogs, réseaux sociaux, etc. (Goldsmith, 2006). La communication électronique est également plus accessible et pour une période indéterminée (Hennig-Thurau *et. al.,* 2004; Sen, 2008; Park et Lee, 2009; Hung and Li; 2007; Lee *et al*., 2008). Contrairement au BAO hors ligne, il est possible de mesurer l'intensité du BAO électronique dans le sens où il est « *observable* » : la quantité d'information partagée sur Internet est accessible à tous, la vitesse de diffusion et le volume des propos partagés par les individus est bien plus important que les avis que la personne pourrait avoir à partir de son entourage dans un contexte non électronique (Chatterjee, 2001).

Les réponses du consommateur suite à un BAO électronique les plus explorées dans la littérature sont l'intention d'achat du consommateur (Bickart et Schindler, 2001; Doh et Hwang, 2009; Huang *et al*., 2009; Park et Lee, 2009; Park et Kim, 2008; Sher et Lee, 2009; Xia et Bechwati 2008; Park *et al*., 2007 ; Lee et Lee, 2009 ; Kelley, 2011 ; Charo *et al*., 2015), son attitude envers certains produits, marques ou entreprises (Doh et Hwang, 2009; Lee *et al*., 2008; Lee et Youn, 2009), l'adoption de l'information pour la réutiliser (Cheung *et al.,* 2008; Cheung *et al.* 2009; Forman *et al.,* 2008; Zhang et Watts, 2008; Lee et Youn, 2009), sa confiance envers le message (Awad et Ragowsky, 2008 ; Sen, 2008; Sen et Lerman, 2007) et l'intention de recommander les produits de l'entreprise autour de laquelle le BAO électronique a eu lieu (Kelley et Marx, 2011).

Le BAO électronique a élargi les groupes de références du consommateur et affecte le comportement du consommateur en général (Sarma et Choudhury, 2015). Un BAO positif accroit les probabilités d'achat, tandis qu'un BAO négatif a l'effet opposé (Gruen *et al.,* 2005). Le BAO électronique affecte également l'évaluation du produit (Dellarocas, 2003 ; Bae et Lee, 2011), l'intention de fidélité (Litvin *et al.,* 2008) et l'image de l'entreprise (Reynolds, 2006). Dans un contexte de BAO électronique, et selon Sundaram *et al.* (2008), les individus pourraient être motivés par (1) leur altruisme en essayant d'empêcher les autres de vivre les mêmes expériences négatives ; (2) leur volonté de réduire leur anxiété, leur colère, en partageant leurs expériences avec les autres ; (3) leur volonté de vengeance et (4) leur désir de trouver des solutions à leurs problèmes.

Dans ce qui va suivre, nous allons nous focaliser sur une des conséquences les plus directes du BAO négatif : le boycott.

2.2 Le boycott : clarification conceptuelle et motivations

Le boycott est appréhendé à un acte de résistance à la consommation. Suite à une crise, une des formes de réactions du consommateur est le boycott (Mitroff *et al.,* 1996). Cette pratique consumériste dénote d'une fracture de la relation entreprise-consommateur et où la confiance entre les deux parties a été altérée. Le boycott a été défini comme étant « *une tentative d'une ou plusieurs*

parties pour parvenir à certains objectifs en exerçant une pression, de manière individuelle, sur des consommateurs afin qu'ils s'abstiennent de faire certains achats sur le marché » (Friedman, 1985, p. 97).

Muraro-Cochart (2003) a relevé que suite à une situation de crise qu'encourt l'entreprise, une des réactions potentielles du consommateur s'articule autour du boycott ou d'un bouche-à-oreille négatif. Ce bouche-à-oreille négatif tend à affecter les ventes d'un produit donné, la visite d'un point de vente, l'influence d'autres consommateurs pour un changement de comportement, etc.

Par ailleurs, le boycott représente une forme intrigante et peu explorée inhérente au comportement du consommateur. En effet, ce concept peu connu s'apparente à une réaction d'abstention d'achat ou de consommation déterminée par une décision prise suite à des considérations et motivations intrinsèques ou extrinsèques au consommateur. Ces motivations n'ont pas fait l'objet de plusieurs recherches demeurant ainsi dans un stade d'exploration surtout dans un contexte initialement généré en ligne.

Le boycott est appréhendé sous un volet plutôt social qui exprime le choix que devrait faire l'individu dénotant d'une certaine opposition entre le désir du consommateur de consommer et le souhait d'un collectif de s'abstenir en termes de consommation (Sen *et al.*, Morwitz, 2001).

Braunsberger et Buckler (2011) ont identifié trois principales motivations poussant l'individu au boycott à savoir (1) des motivations instrumentales qui consiste en un désir de forcer la cible au boycott et à un changement social manifeste ; (2) motivations non instrumentales ou autrement appelées boycott expressif (Capelli *et al.*, 2012) où le consommateur exprime son mécontentement vis-à-vis de l'entreprise. Ce boycott est susceptible d'être initié de manière individuelle en signe de protestation ou de suivisme de l'action collective ; (3) les coûts engendrés par le boycott dans le sens où plus il y a présence de produits de substitution de qualité plus le coût est moins élevé.

Une quatrième motivation à savoir celle morale a été évoquée par Capelli *et al.* (2012). Elle repose sur le désir de l'individu à préserver ses valeurs intrinsèques et à conserver son estime de soi (John et Klein, 2003). Le consommateur s'engage dans une intention de boycott s'il estime que le produit va à l'encontre de son système de valeurs. Garrett (1987) a, quant à lui, identifié six déterminants de participation au boycott à savoir : la prise de conscience des consommateurs, les valeurs des consommateurs potentiels participants, la cohérence des objectifs de boycott avec les attitudes des participants, les frais de participation, la pression sociale et la crédibilité du leadership du boycott.

Il est important de préciser que peu d'études se sont focalisées sur les motivations conduisant au boycott des consommateurs (Klein *et al.*, 2004). La plupart des recherches portant sur le boycott sont plus descriptives et conceptuelles (Klein *et al.*, 2004). Néanmoins, en brossant un état des lieux sur la littérature s'y afférent, il convient de souligner l'apparition de certains facteurs culturels susceptibles d'influencer le comportement de consommation. Pour présenter le rôle de ces facteurs culturels, il est pertinent de pointer le concept du boycott qui « *survient lorsqu'un certain nombre de personnes s'abstiennent d'acheter un produit, au même moment, en réaction au même acte ou comportement grave, mais pas nécessairement pour les mêmes raisons* » (John et Klein, 2003, p. 1198). D'après ces chercheurs, le boycott ou l'intention de boycott prend naissance suite à un comportement grave de l'entreprise. Ce comportement est susceptible de comporter des signaux qui vont à l'encontre du *background* culturel de l'individu.

Chaque individu a son propre *background* culturel et l'évaluation d'un stimulus s'opère en comparant les signaux transmis par ce dernier avec le référentiel individuel spécifique à lui. Cette évaluation repose sur la théorie de l'assimilation (*Social Judgement Theory*) (Sherif et Hovland, 1961). En cas de décalage entre les signaux émis par l'entreprise et le *background* culturel de l'individu, un malaise est susceptible d'apparaître pouvant générer une situation de crise entre les deux parties. Le boycott ou l'intention de boycott sont initiés suite à des raisons d'ordre culturel. Jensen (2008) a souligné que pour des raisons qui incombent à la religion, les musulmans ont décidé de boycotter les produits danois suite à la publication d'illustrations portant atteinte au prophète Mahomet. La religiosité des individus s'est trouvée affectée par ces stimuli touchant au sacré.

En outre, le boycott n'est pas seulement une action collective mais il marque avant tout un engagement personnel de l'individu et reflète ainsi un acte de résistance envers l'entreprise (Cissé-Depardon et N'Goala, 2009). Cet acte de résistance est une forme d'expression des propres valeurs individuelles du consommateur qui en refusant de consommer respecte son système de valeurs. Malgré les différentes recherches sur le boycott et ses motivations, le lien avec le BAO électronique et la culture du consommateur n'a pas réellement fait l'objet d'investigations antérieures.

3. Méthodologie

La littérature existante apporte des réponses quant au rôle de la culture dans la détermination de la fréquence et de l'intensité du BAO traditionnel (Money *et al.*, 1998). Les recherches antérieures montrent, à titre d'exemple, que les cultures individualistes sont plus autonomes et moins conformes aux autres (Albers-Miller et Gelb, 1996), elles peuvent, alors être moins sensibles aux BAO, tandis que les sociétés collectivistes sont plus consensuelles (Lin, 2001). La culture à laquelle le consommateur appartient pourrait déterminer, d'une manière ou d'une autre, la manière avec laquelle il appréhende un message dans le cadre d'un BAO et ses probables réactions. Le lien des variables culturelles avec le BAO électronique a pourtant été peu exploré (Pentina *et al*., 2015), et encore moins lorsqu'on considère le boycott comme étant la conséquence d'un BAO négatif. D'où le recours à une méthodologie de recherche qualitative. Cette méthodologie s'est déroulée en deux étapes : netnographie et réunions de groupes thématiques.

3.1 Netnographie

La netnographie est une méthode de recherche qualitative qui consiste à analyser les propos partagés par les internautes: messages postés sur les forums de discussion, répliques échangées dans un chat, courriers électroniques, etc. L'objectif est de cerner une problématique marketing en analysant des communautés qui peuvent orienter le chercheur vers des pistes de recherche ou de comprendre un phénomène peu exploré sur lequel les participants s'expriment en ligne (Kozinets *et al*., 2010).

Le principal objectif de la netnographie était de recenser l'ensemble des messages partagés ayant suscité un BAO négatif sur les réseaux sociaux et de noter les différents commentaires des répondants. Les étapes préconisées par Kozinets (2010) ont été respecté :

- *Entrée* : un groupe sur Facebook a été choisi *« Les bons plans de Tunisie : officiel »*. Ce groupe comporte principalement des membres tunisiens composant une communauté d'internautes à la recherche de bons plans. Le groupe a été choisi compte tenu de nombre évolutif de membres, du flux d'information régulier, du trafic important et de la variété de messages ayant créé des BAO négatifs. Il est dédié au partage de bons plans, astuces, idées, promotions mais aussi un lieu pour discuter des « *mauvais plans* ».
- *Collecte des données* : plusieurs messages négatifs ont été partagés par les membres. Nous avons analysé les différents commentaires postés par les membres pour comprendre leurs réactions. Les messages négatifs choisis tournaient autour de produits, de marques, de chaines télévisées ou d'employés (généralement des vendeurs) ayant suscité des réactions négatives de la part des consommateurs.
- *Analyse des données et interprétation* : les messages ont été classés pour retenir les messages ayant créé un BAO plutôt négatif. Les différents commentaires représentatifs des réactions des consommateurs et de leurs intentions suite à leur prise de connaissance de l'information partagés ont également étaient classés et analysés.
- *Validation par les participants et éthique* : les participants ont été contactés pour discuter des principaux résultats ressortis et les valider.

Suite à cette étape, il était possible de cerner les grandes lignes déterminantes de l'intention de boycott suite à un BAO électronique négatif. Certaines variables culturelles ont également été ressorties. Pour aller plus en profondeur, des participants ont été recrutés pour une deuxième méthode de recherche qualitative : les réunions de groupe.

3.2 Réunions de groupe thématiques

Après avoir recensé l'ensemble des commentaires négatifs des internautes, des membres ont été contactés pour organiser des réunions de groupe. Deux groupes ont été formés, composés respectivement de neuf et huit membres. Les deux groupes comportaient des membres assez hétérogènes d'un point de vue âge, sexe, profession et niveau d'instruction (Tableau 1). Les réunions en groupe avaient une durée moyenne de 60 à 75 minutes et tournaient autour de quatre axes :

- Discuter des messages ayant suscité un BAO électronique négatif récemment ;
- Comprendre les raisons derrière cette perception négative ;
- Explorer les différentes conséquences de cette perception ;
- Le boycott, ses motivations « culturelles ».

Tableau 1. Caractéristiques de l'échantillon qualitatif

	Code répondant	Genre	Age	Profession
Focus group 1	**R1.1**	Homme	18 ans	Etudiant
	R1.2	Homme	42 ans	Cadre moyen
	R1.3	Femme	36 ans	Ingénieur
	R1.4	Homme	44 ans	Enseignant
	R.1.5	Femme	22 ans	Etudiante
	R.1.6	Femme	27 ans	Enseignante
	R.1.7	Femme	20 ans	Etudiante
	R.1.8	Homme	32 ans	Sans emploi
	R.1.9	Femme	30 ans	Commerciale
Focus group 2	**R2.1**	Femme	29 ans	Enseignante
	R.2.2	Homme	38 ans	Chef d'entreprise
	R.2.3	Femme	28 ans	Sans emploi
	R.2.4	Homme	49 ans	Cadre dans une banque
	R.2.5	Homme	30 ans	Technicien
	R.2.6	Homme	19 ans	Etudiant
	R.2.7	Femme	22 ans	Etudiante
	R.2.8	Femme	47 ans	Employé dans un ministère

Les groupes ont été animés autour des axes de discussion cités précédemment. Les deux groupes ont évoqué plusieurs messages ayant suscité des BAO négatifs, ont révélé les raisons pour lesquelles ils ont considéré ces messages comme négatifs, ont mentionné des répercussions de ces BAO négatifs sur leurs comportements, en donnant des exemples, et ont fini par parler de leurs intentions de boycott envers certains produits et marques. Les motivations culturelles ont été explorées au fur et à mesure qu'ils expliquaient leurs différentes perceptions négatives et les répercussions sur leur attitude envers certaines marques. Les discussions ont été enregistrées et retranscrites.

Nous avons analysé le corpus ressorti de la netnographie et des réunions de groupe. L'analyse était thématique et a été faite manuellement. Le codage s'est réalisé sur trois étapes (Miles et Huberman, 2003) : (1) codage *invivo* ouvert pour faire ressortir tous les thèmes sans prise en considération des relations hiérarchies entre eux ; (2) codage axial durant lequel nous avons réalisé un aller-retour entre la littérature et les thèmes ressortis au codage ouvert, principalement pour réexaminer les variables culturelles dans la littérature et le rapport avec le BAO négatif d'une part et l'intention de boycott d'autre part ; (3) codage sélectif pour une réorganisation finale des thèmes et une hiérarchisation thématique logique.

4. Résultats

La figure 1 résume les principaux résultats ressortis de l'analyse thématique. Les résultats mettent en avant le rôle du BAO électronique négatif dans la détermination du comportement du consommateur hors ligne et, plus précisément, de son intention de boycott. Ils mettent également en lumière le rôle principal joué par les variables culturelles aussi bien lors de la perception du message ayant suscité un BAO sur les réseaux sociaux que dans la détermination de l'intention de boycott de certaines marques, produits, lieux ou entreprises ayant fait l'objet de ce BAO.

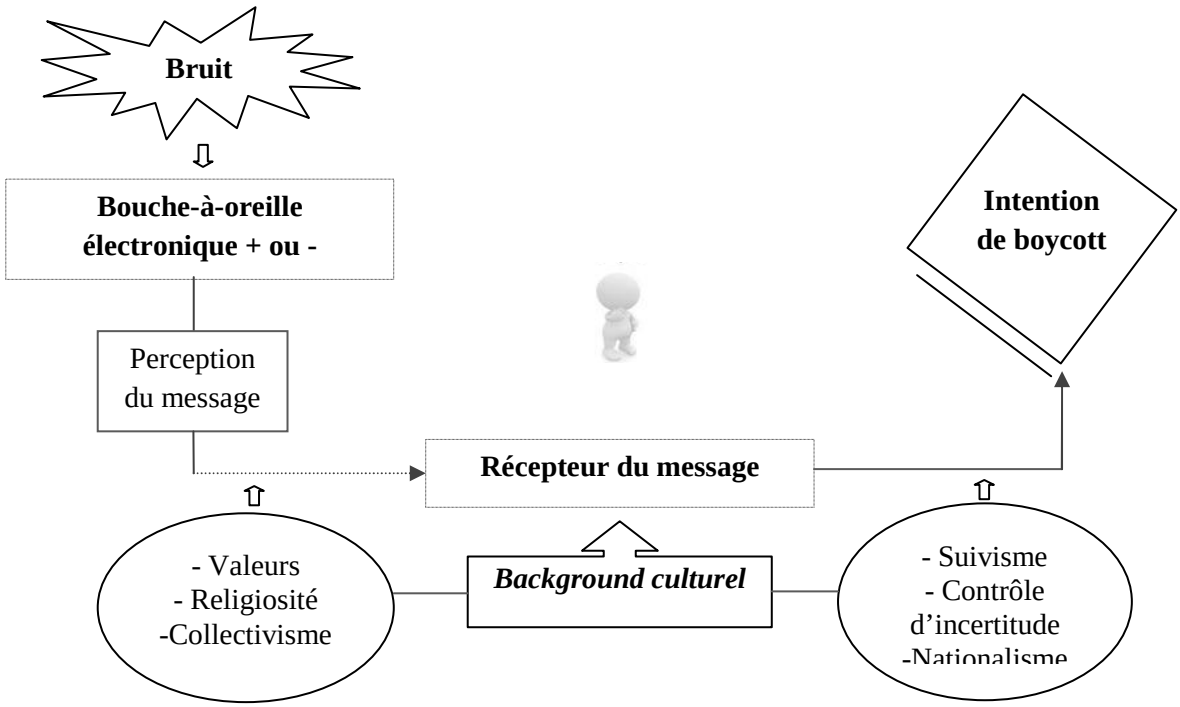

Figure 1. BAO électronique et intention de boycott : rôle des variables culturelles

4.1 Rôle du BAO électronique dans la détermination du boycott

A l'origine de l'intention de participation de boycott, le BAO électronique représente l'élément précurseur de cette décision du consommateur. De prime abord, il convient de préciser que la majorité des répondants s'accorde à dire que les informations transmises et partagées sur les réseaux sociaux ont tendance à influencer leurs décisions.

> « *Vu que nous sommes tout le temps connectés sur Facebook, toutes les actualités et les appels au boycott sont facilement partagés entre les membres et de manière instantanée. Quand je lis des commentaires négatifs, je suis plus enclin à participer à l'action de boycott* » (R1.3, 36 ans).

Certains informants ont évoqué le rôle du BAO électronique négatif dans le processus de traitement de l'information et d'assimilation. En effet, au début de ce processus, des commentaires et des informations sont partagés. Le récepteur du message décode ce BAO négatif et prend une décision

qui peut se matérialiser à travers une intention de boycott. Enfin, vu qu'il est convaincu de son choix, il peut partager cet appel au boycott sur les réseaux sociaux et devient ainsi un relais actif.

> « *Quand je vois certains commentaires sur Facebook et appels au boycott parfois j'adhère à ces actions. Je fais ma propre analyse et je prends la décision en adhérant à l'action ou pas. Si je suis convaincu de la cause, je partage l'appel au boycott* » (R2.5, 30 ans).

Quelques interviewés ont mentionné le fait que la crédibilité du message transmis et/ou la personne qui partage ce message a une importance primordiale dans la prise de décision quant à l'intention de boycott.

> « *Avant de m'avancer dans une action, je m'assure que les faits sont repris de manière intègre et honnête. La source est importante dans mon choix* » (R1.4, 44 ans).

> « *On a tous un ami Facebook connu pour son sérieux et son sens de l'analyse et de critique. Quand il partage un appel au boycott, j'ai tendance à cliquer sur l'évènement partagé et à adhérer en considérant que les données partagées fiables et en me fiant à son interprétation* » (R2.7, 39 ans).

Il est important, pour la majorité des participants à l'enquête qualitative, de s'assurer que le message est bel et bien vrai, que la source du message est fiable, bien avant de s'engager dans de futures décisions. Ce résultat vient corroborer celui de Garrett (1987) qui met en avant l'importance de crédibilité du message favorise la participation au boycott. Pour assurer cette crédibilité, il est important que la personne ayant partagé cette information soit « fiable » et que les photos partagées soient bien réelles et non pas empruntées des banques d'images en ligne. Dans certains cas, des annonces mensongères peuvent être partagées par certaines pour toucher à la réputation de leurs concurrents. Certains consommateurs peuvent s'en rendre compte :

> *« J'ai déjà vu des publications où on a l'impression qu'il s'agit simplement d'une action d'un concurrent ! Beaucoup de restaurants par exemple créent de faux profils et racontent n'importe quoi rien que pour influencer les autres, les consommateurs ne sont pas dupes, parfois ça saute aux yeux qu'il s'agit d'une diffamation ! »* (R.1.4, 44 ans).

4.2. Variables culturelles et perception du BAO électronique

Les variables culturelles peuvent déterminer, en grande partie, la manière avec laquelle le consommateur perçoit le message publié par les autres et son interprétation. En effet, la majorité des informants sont fortement influencés par leurs valeurs lors de l'interprétation des messages ayant créé un BAO. A titre d'exemple, en examinant le groupe social étudié à la première phase exploratoire, à savoir la netnographie, certains membres sont plus touchés par les messages où on dénonce un évènement qui touche à un bien commun, tel que la destruction d'un arbre centenaire, tandis que d'autres n'en sont pas choqués et s'inquiètent plutôt de problèmes qui les touchent de plus près tels que le chômage ou les inégalités sociales. Les « collectivistes » auront, de ce fait, plus tendance à exprimer leur mécontentement par rapport à tout ce qui pourrait toucher au groupe auquel ils appartiennent, à la société.

> *« On en a marre de voir tous les jours nos plus beaux arbres centenaires abattus à la chaîne! Un arbre met des dizaines d'années, de génération en génération, à grandir, et à se développer pour nous offrir tous ses bienfaits. Il suffira de quelques minutes pour que la cupidité et la sauvagerie d'un commerçant décide de le sacrifier à ses intérêts mercantiles et d'en priver les générations futures » (voir lien :*

https://www.facebook.com/groups/plantesdinterieuretjardinsTunisie/permalink/10153934586884291/)

Par ailleurs, d'autres personnes attachées à leurs valeurs religieuses seraient plus sensibles à des messages touchant à la religion, ils sont plus enclins à les partager à leur tour. Les personnes « *acculturées* » n'y accorderaient pas autant d'attention.

> *« Ces chaînes télévisées qui osent diffuser des feuilletons durant le mois de Ramadan où l'on parle librement d'alcool, de concubinage et où les actrices sont presque nues… Il est tout à fait normal que je partagerai mon mécontentement, il faut que les autres le sachent, c'est inconcevable qu'on continue à les regarder »* (R.2.8, 47 ans).

4.3. Motivations « culturelles » de l'intention de boycott

La majorité des informants évoque que le type de boycott le plus répandu est l'expressif dans le sens où il est possible d'exprimer leur mécontentement voire leur colère à l'encontre d'un comportement d'une entreprise « incongruente » avec leur *background* culturel.

> « *Lorsque je décide de m'abstenir à aller à un salon de thé et ayant une intention de boycott c'est que je m'oppose à ce genre de pratique barbare qui consiste à arracher un arbre bicentenaire juste pour que ce salon de thé ait une vue dégagée* » (R1.2, 42 ans).

> *« Il y a une pétition à signer, il faut boycotter cet espace » (voir lien : https://www.facebook.com/groups/lesplandeTunis/search/?query=mirador)*

Plusieurs commentaires issus du forum de discussion et certains répondants des *focus groups* affirment que la principale raison qui motive au boycott est celle inhérente aux valeurs individuelles.

> « *Si j'accepte l'idée de boycotter un produit c'est que quelque part il existe un élément en contradiction avec mes valeurs personnelles* » (R1.9, 30 ans).

Certains répondants relèvent l'existence d'une distorsion entre les valeurs individuelles et les signaux transmis de l'entreprise. Cette distorsion a tendance à accroître l'intention de boycott.

> « *En constatant qu'il y a divergence entre mes valeurs personnelles et le message transmis, le degré de colère sera plus important vu que l'entreprise ou le point de vente a fait en sorte de ne pas me respecter. C'est une atteinte à ma personne. Je serai plus enclin à avoir une intention de boycott* » (R.1.2, 42 ans).

Certains répondants affirment qu'une des raisons potentielles motivant le boycott ou l'intention au boycott est le nationalisme dans le sens où l'identité culturelle nationale prévaut sur les considérations de la cible.

> « *J'aime mon pays et je trouve que certaines marques ou lieux reflètent notre identité nationale. Quand on les touche, on porte atteinte à notre croyance et amour pour ce pays* » (R.1.4, 44 ans).

L'exemple d'un opérateur de téléphonie mobile dont le nom était extrait du nom du pays ciblé « Tunisiana » en référence à la Tunisie. Lors d'une stratégie de *rebranding*, les clients se sont aperçus que l'opérateur n'est plus tunisien mais ayant une provenance du Moyen Orient et la dissociation de la symbolique du nom de l'entreprise a marqué certains clients qui ont lancé un appel au boycott. Le nationalisme apparait, de ce fait, comme une variable culturelle fondamentale dans la détermination du boycott suite à un BAO électronique négatif. Les individus se trouvent généralement touchés par tout message partagé où l'on met l'accent sur une entreprise ou une marque qui ne respecte pas leur amour pour la patrie.

> « *Pourquoi changer de nom ? C'était porteur d'un sens utilisé sciemment pour exprimer une identité nationale* » (R.2.1, 29 ans).

D'autres répondants évoquent un autre antécédent culturel à l'origine de l'intention au boycott qui est le bien être individuel ou social. Des actions engagées et socialement responsables sont lancées afin de préserver la nature et les droits du citoyen avant d'être consommateur.

> « *Un salon de thé la Phalène qui a envahi le trottoir en construisant une terrasse illégalement aux dépens du droit de passage du piéton dans une totale impunité de la part des autorités va à l'encontre de mes valeurs. Un appel au boycott a été lancé et j'ai participé un rassemblement devant ce salon de thé* » (R.2.8, 47 ans).

> « *Ça me rappelle ces derniers jours un autre salon de thé le Mirador qui a arraché un arbre bicentenaire juste pour avoir une vue dégagée. De quel droit il arrache un arbre de 200 ans ? C'est un massacre à la tronçonneuse ! Après nos efforts, il a été condamné à neuf mois de prison. Il ne faut pas se taire, il faut agir en boycottant pour faire réagir les autorités et faire hésiter ceux qui oseront toucher à la nature* » (R.2.1, 29 ans) (voir annexe 1).

Quelques participants mentionnent que parfois ils adhérent à des actions de boycott dans un souci de « suivisme » vu qu'ils appartiennent à des groupes sociaux et ne veulent pas déroger aux règles établies. Selon Kelman (1961), le suivisme est un des degrés les plus « légers » de conformisme et qui consiste à se soumettre à certaines actions collectives rien que pour éviter des désagréments tels que le rejet ou la répression.

> « *Parfois, je participe à une action car le groupe auquel j'appartiens le fait donc pour ne pas susciter des suspicions ou des interrogations j'adhère à l'action* » (R.1.1, 18 ans).

L'individu participe, dans certains cas, à une action de boycott rien que pour afficher son appartenance à un groupe qui dénonce des actions bien particulières, telles que la défense des droits des homosexuels, afficher son « ouverture d'esprit » sans que cela soit son véritable point de vue, il continue à suivre certains de ses amis sur les réseaux sociaux qui recherchent le « *m'as-tu vu* ? ».

> « *J'ai des amis qui ne croient pas à la cause du boycott mais le font juste pour être perçu comme leurs amis reconnus comme les défenseurs des droits des animaux ou de la nature qui eux aussi ne croient pas en cette cause car ils suivent des modèles jugés frimeuses* » (R.1.5, 22 ans).

D'autres antécédents ont été évoqués à savoir ceux ayant trait aux tabous et faisant intervenir des valeurs comme la pudeur et le respect d'autrui.

> « *Je me rappelle qu'au cours du mois saint de Ramadan, il y avait une forte audience avec des familles qui regardaient la télévision et une chaîne TV diffusait des feuilletons qui comportaient des contenus à connotation sexuelle. C'est inacceptable et incohérent avec notre culture arabo-musulmane et tunisienne. Ça nous a choqués à la maison et nous avons répondu par l'affirmative pour l'appel au boycott de la chaîne TV en question* » (R.2.4, 49 ans).

Une dernière variable culturelle ressort de l'analyse des propos des participants à l'enquête qualitative et qui semble clairement déterminer l'intention de boycott des consommateurs de certaines marques, produits ou entreprises : le contrôle d'incertitude. Selon Hofstede (1991), le contrôle d'incertitude est *« le degré d'inquiétude de ses habitants face aux situations inconnues ou incertaines. Ce sentiment s'exprime, entre autres, par le stress et le besoin de prévisibilité : un besoin de règles, écrites ou non »* (p.149-150). En effet, certains individus adhèrent à une action de boycott

par besoin de prévision, d'avoir des règles claires, des actions bien déterminées pour minimiser leur degré de méconnaissance de certaines situations.

> *« C'est rassurant d'avoir la possibilité de voir ce que les autres ont vécu, Facebook m'aide beaucoup dans ce sens, ça m'a déjà aidé à réduire le risque d'être arnaqué par des restaurants par exemple. Si le service était médiocre pour les autres, il le serait forcément pour moi. Je ne souhaite pas refaire la même expérience et l'expérience des autres m'éclaire et m'aide à prendre les bonnes décisions dans l'avenir »* (R.1.3, 36 ans).

5. Conclusion

Tous les jours, des millions de messages sont partagés sur la toile. Certains attirent l'attention des internautes plus que d'autres. Cela dépend, généralement, du degré d'importance que portent les individus au message partagé. Certains messages finissent par créer un BAO, positif ou négatif. A ce stade, des variables culturelles peuvent affecter la perception du message, telles que les valeurs, la religiosité, le collectivisme et l'acculturation. En effet, les valeurs de l'individu peuvent influencer la manière avec laquelle la personne perçoit le message. A titre d'exemple, certains sont attachés à certaines valeurs telles que le bien-être social et prêtent plus d'attention aux messages qui concernent les problématiques sociales (écologie, égalités sociales, etc.), tandis que d'autres individus attachés à leurs valeurs religieuses peuvent plutôt se trouver plus touchés par tout ce qui pourrait être à l'encontre de la religion (nudité, etc). Une fois le message perçu positivement ou négativement, les variables culturelles agissent, dans un deuxième temps, comme variables déterminantes des réactions des consommateurs suite à un BAO positif ou négatif. Certaines personnes sont plus « conformistes » que d'autres, auront tendance à suivre les autre par solidarité et agissent conformément aux autres membres de leur groupe de référence. Ils sont, de ce fait, plus sensibles aux actions communes comme le boycott. Certains s'engagent dans une action de boycott pour assurer un meilleur contrôle de risques liés à la consommation du produit ayant crée un BAO négatif, par souci de contrôle d'incertitude. Ils trouvent alors, dans le boycott, un moyen de prévision et de contrôle. Ils peuvent également être poussés par l'amour de leur patrie lorsqu'une entreprise touche à leur nationalisme, le consommateur s'engage dans des actions de boycott pour défendre sa nation et le bien du pays.

Les variables culturelles jouent, de ce fait un double rôle : un premier rôle concerne la perception du BAO électronique et un deuxième la réaction suite à ce BAO et la détermination de l'intention de boycott. Le présent travail de recherche apporte alors des réponses quant au rôle de la culture dans la détermination du boycott suite à un BAO électronique négatif. N'ayant pas de contrôle sur le BAO électronique, les entreprises sont tenues à comprendre la manière avec laquelle les consommateurs perçoivent, interprètent et répondent aux différents messages ayant suscité un BAO sur la toile. Elles peuvent engager des personnes pour surveiller de près les réactions des consommateurs sur les réseaux sociaux et intervenir avant que la propagation des messages. Par ailleurs, pour limiter le « suivisme » des consommateurs, elles peuvent jouer la carte de la transparence, apporter des éclaircissements, des explications et pourquoi pas des excuses pour arrêter la diffusion du message négatif avant la mobilisation des consommateurs autour d'actions comme le boycott. Réagir à temps est l'une des meilleures solutions que l'entreprise pourrait adopter pour répondre aux messages négatifs émis par ses clients. Par ailleurs, lors de la conception de ses campagnes de *buzz* marketing, les managers sont appelés à analyser l'ensemble des évènements ayant suscité un BAO en ligne pour choisir l'axe sur lequel ils pourront axer leur campagne.

Comme voies futures de recherche, il serait possible de suivre l'évolution de quelques évènements en ligne depuis leur apparition, à leur diffusion allant jusqu'à la mobilisation des consommateurs autour d'actions communes. Le processus étudié pour chaque évènement pourrait donner une idée plus claire sur la manière avec laquelle l'individu perçoit, interprète et analyse les messages émis par les autres. Une étude longitudinale pourrait également être intéressante et cela en interrogeant les consommateurs à plusieurs moments de leur vie et suivre l'évolution de leurs réactions face à un BAO négatif. Une étude interculturelle permettrait aussi de cerner le rôle des variables culturelles dans la détermination du boycott dans des cultures variées et maîtriser, de ce fait, l'ensemble des

variables pouvant intervenir dans la détermination des réactions des consommateurs suite à des BAO électroniques négatifs.

Regional Economic Integration in West Africa and Cocoa Beans Value Chain in Nigeria

Abstract

The regional platforms put in place by the Economic Community of West African States (ECOWAS) are supposed to be able to proffer solutions to some of the challenges of the cocoa beans value chain in Nigeria. These challenges, *inter alia*, are low value addition and consequently low productivity- these hamper the performance of the cocoa beans value chain in Nigeria – a value chain regarded as strategic according to the Agricultural Transformation Agenda of Nigeria in 2010. In economic literature, inter-linkages amongst related or same industries are important for value addition which in turn is essential for maximising income gains and improving general living standards of all actors engaged in the entire production and trade processes in a value chain. The New Trade Theory explicates how intra-industry/intra-regional trade can give rise to the fragmentation of production processes that characterise value chains and how intra-regional trade can foster the needed value addition in a value chain. This current study is motivated by the need to assess the extent to which the Economic Community of West African States (ECOWAS) has fostered the performance of the cocoa beans value chain in Nigeria by creating the necessary forward and backward linkages between actors in the cocoa beans value chain in Nigeria and the rest of ECOWAS. The findings from descriptive statistics seem to suggest a weak performance on the part of ECOWAS thus calling for the need for intensified regional efforts to sufficiently bolster the performance of the cocoa beans value chain in Nigeria.

JEL Classification: C67; F14; F15

Keywords: Regional Economic Integration; ECOWAS; Cocoa Beans Value Chain; Nigeria

1.0 Introduction

Economic Integration (EI), an embodiment of custom unions, trade blocs and free trade, has an ultimate aim of fostering trade participation of Member countries and enhance economic performance and welfare of their citizenry in the long-run (Olayiwola, Osabuohien and Okodua, 2011). Baldwin and Venables (2004) noted that discriminatory trade policy is the defining characteristic of a regional integration arrangement. EI instruments could be in form of tariff or non-tariff measures. EI entails the partial or full removal of trade tariffs across national boundaries with the aim of lowering prices and fostering the welfare of citizens in the Member States (Dalimov, 2009).

The agricultural sector is of importance to ECOWAS Member states including the Nigerian economy as it contributes consistently about 75 percent to the non-oil exports of Nigeria (Adesina, 2012). In the bid to transform the agricultural sector of the country and use it to foster its economic growth, Nigeria embarked on an Agricultural Transformation Agenda - ATA in 2010. Some agricultural products were earmarked as priority commodities in order to achieve the objectives of the Transformation Agenda. One of the prioritised commodities is cocoa beans. However, recent literature such as United Nations Economic Commission for Africa (UNECA), Adesina (2012) and Ogunleye (2014) harped on the importance of paying attention to the entire value chain to deliver the income and other welfare gains to all actors rather than laying emphases on mere increases in production. The Agricultural Transformation Agenda noted cocoa beans value chain as a strategic commodity value chain that is expected to generate over 350,000 jobs in primary production,

plantation establishment and across its value chain in 2015. In the context of a regional economic community, cocoa beans value chain would imply that the production processes are fragmented across national borders within the region. For instance, within ECOWAS, production of cocoa beans may be done in Ghana, processing done in Benin and marketing and selling to final consumers done in Nigeria.

Nigeria is the fourth largest exporter of this commodity in the world after Cote d'Ivoire, Indonesia and Ghana, respectively. Despite the huge potentials of this commodity, it is characterised by low value addition and productivity which retard the gains of actors along its value chain (Ajetomobi, 2011; Nwachukwu *et al,* 2010). However, on the positive end, FMARD (2012) reported that notwithstanding the drop in production and yield, Nigeria remains the world's fourth largest exporter of cocoa beans.

The platforms created by ECOWAS are expected to be able to proffer solutions to some of the challenges of this sector. These platforms include the ECOWAS Trade Liberalisation Scheme (ETLS) meant to allow for free movement of goods, people and services and removal of trade barriers within this region; the ECOWAS Agricultural Policy (ECOWAP) meant to improve productivity and competitiveness of the agricultural sector of Member states. *Inter alia*, other platforms include the Regional Agricultural Investment Programme (RAIP) and the ECOWAS Bank for Investment and Development (EBID) and are meant to provide the needed funds for agriculture. These platforms are also expected to enhance the value chain in agriculture (United Nations Economic Commission for Africa – UNECA, 2012) including the cocoa beans value chain thus bringing about value addition and productivity increase. But to guarantee substantive value addition, there is the need for inter-linkages (forward and backward) amongst the cocoa industries within the region. The primary question this study raises is "to what extent is ECOWAS bringing about these inter-linkages within the region?" On the flip side, value chain proponents also opine that substantial value addition in a given value chain can give rise to increased intra-regional trade (Gor, Mbithi & Osoro, 2014; Meng, Fang and Yamano, 2012). In this vein, this study also seeks to know to what extent the value that is added in the Nigerian cocoa beans value chain is fostering intra-regional trade. This is an area still grossly underexplored in West Africa. Similar studies are those of Meng, Fang and Yamano (2012), Meng, Zhang, Guo and Fang (2012) both in China and the work of Putri, Sutopo, Prihawantara and Matheos (2015) on "value chain improvement for cocoa industry in Indonesia by input-output analysis" appears to be the most similar to this current study.

1.1 Research Objectives

The broad objective is to analyse the nexus of regional economic integration and cocoa beans value chain in Nigeria. The specific objectives are, to:

1. analyse the value-addition effect of regional economic integration on value chain of cocoa beans of Nigeria in the context of backward linkage;
2. analyse the value-addition effect of regional economic integration on value chain of cocoa beans of Nigeria in the context of forward linkage; and
3. estimate the impact of value addition of cocoa beans value chain on trade flows between Nigeria and ECOWAS.

2.0 Conceptual Framework

This section briefly illustrates the link between the theory adopted for this study and the broad objective of the study.

Intra-industry trade, as theorized by the new trade theorists, results from firms/ industries' abilities to internalize economies of scale thus paving the way for increasing returns to scale and imperfect competition. Given a monopolistic type of imperfect competition, an industry produces differentiated or unique products leading to an enlarged market, enlarged production scale and more varied products to consumers concentrated in a particular country. And given that each country produces varieties of that particular product, stemming from the love of consumers for varieties, a country exports its unique product to another country and imports the variety of the other country of that same product. In this way an intra-industry trade is created. This intra-industry trade, in recent times, is however more common with intermediate goods (OECD, 2014) thus giving room for specialization along better defined comparative advantages and providing wider options for producers to purchase a

given input that they may be incapable of producing consequently leading to fragmentation of production processes (Gonzalez and Holmes, 2011).

Some insights with regards the theory-objective nexus could also be garnered from other relevant theories such as the comparative advantage theory, heterogeneous firm theories and new economic geography/location theory.

3.0 Stylised Facts: Trend Analyses

Regional Economic Integration in ECOWAS: (A) Intra-regional trade flows and (B) the extent of trade facilitation, as indicators of the performance of ECOWAS

A) Intra-regional Trade Flows

Figure 1 shows an increased intra-regional flows in the second half of 2000s especially from 2006 till more recent times as compared with the first half suggesting an increased performance, in this respect, of ECOWAS in the second half till 2013. From table 1, the two indicators (infrastructure and regulation) show the need for more regional efforts on the part of ECOWAS to benefit the actors in the cocoa beans value chain in Nigeria as Nigeria's performance is relatively poor when compared to the performance of others. More regional efforts are needed because actors in the cocoa beans value chain in Nigeria need information about the intra-regional cocoa beans market and so need sufficient access to telecommunication. They also need supportive regulatory environment for their production and trade activities.

Cocoa Beans Value Chain in Nigeria

A) Mapping: As suggested by Kaplinsky and Morris

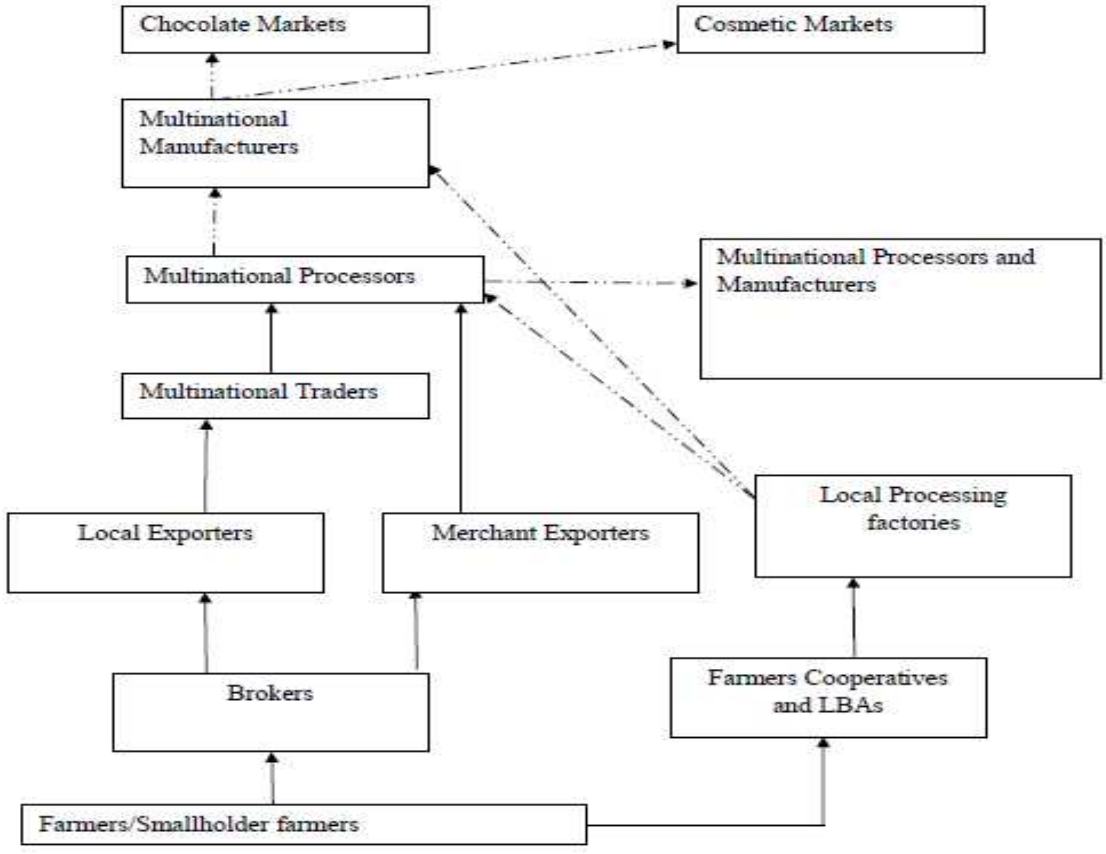

Fig. 2: The Nigeria's cocoa beans global value chain

Source: Adapted from Adewuyi, Babatunde & Bankole (2014)

B) *Comparative Performance Assessment Using Benchmark Data*

Kaplinsky and Morris (2002) opine that one of the ways to assess the performance of a product's value chain is to benchmark the production efficiency/productivity against leading firms/countries in that given value chain. In this respect, given that Cote d'Ivoire, Indonesia and Ghana are the world top three leaders in cocoa beans exports, their productivities (proxy by productivity per hectare/yield of cocoa) are compared to that of Nigeria using trend analysis.

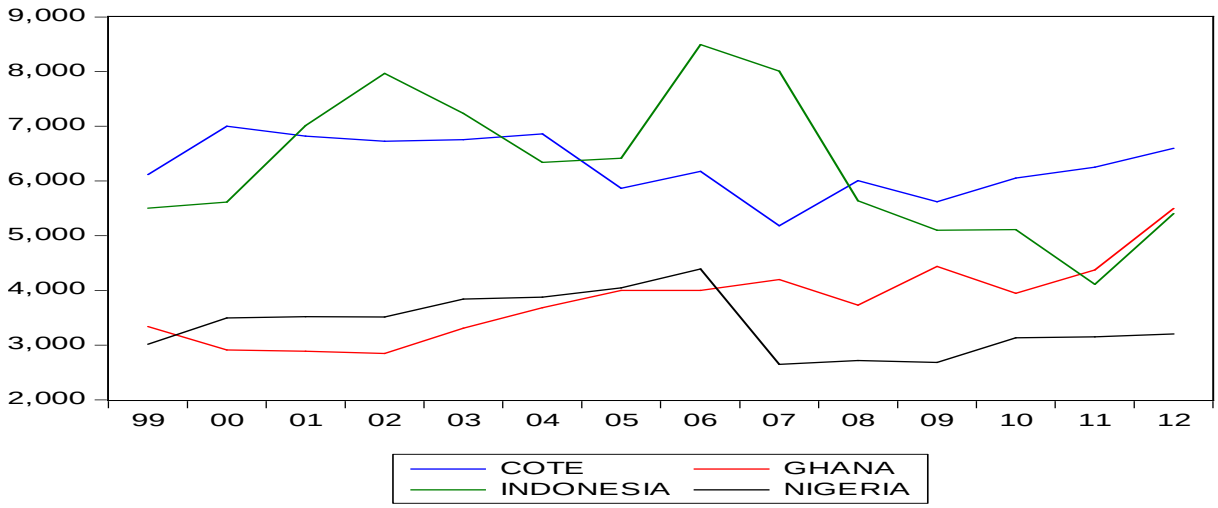

Figure 3: Trend in Value Chain Productivity

Source: Authors' computation from FAOSTAT (2014)

Fig. 3 also shows that Nigeria lags seriously behind others. Relating the Nigeria-ECOWAS trade flows (an indicator of economic integration) as presented in fig. 1 and the productivity of the cocoa beans value chain in Nigeria, in the first half of the 2000s, the trends showed a gradual and steady increase in the trade flows and productivity thus suggesting a positive relationship between them. However, in the second half of the 2000s up to 2013, the trend in the former fluctuated while that of the latter decreased sharply after 2007 thus showing an ambiguous relationship between the two.

From the stylized facts and trend analyses, some insights into the performance of ECOWAS and the cocoa beans value chain in Nigeria and the relationship between the two concepts have been garnered. Notwithstanding, there is the need to empirically estimate the relationship between them in order to corroborate the descriptive analysis done in this section. The Input-Output analytical technique – an inter-industry analysis -will be used for this purpose. The ECOWAS Input-Output table is the main source of data. The RAS technique – a biproportional matrix adjustment technique, is proposed, in order to circumvent the short falls associated with Leontief's basic input-output model. The Value Added in Trade (VAiT) will be used as the measure of the performance of the value chain while the Trade in Value Added (TiVA) will be used to measure the performance of regional economic integration. *A priori*, it is expected that regional economic integration will significantly foster the needed forward and backward linkages and that with the aid of regional efforts, the value added in trade in the Nigerian cocoa beans value chain should significantly increase intra-regional trade flows i.e. Nigeria-ECOWAS cocoa beans trade flows.

Abstract

The impact of the pre-accession assistance measures on the Romanian agriculture is yet a controversial topic, as the agricultural sector is one of the sectors with high growth and development potential at national level. Introducing special assistance programmes such as SAPARD, backed by the need to accomplish a series of structural reforms, proved to be a bold move whose effects still require a thorough analysis even after more than 10 years since their beginning. In this article, we have analyzed the impact of SAPARD programme on the agricultural sector in Romania 10 years after its closure, while also having made a reference to the NRDP Programme that followed, based on the statistical data available at national and European level. The conclusions, after analysis, highlighted the idea that introducing the SAPARD and NRDP programme in agriculture brought an invaluable contribution to the development of this sector.

Key words: *agriculture, accession period, Romania, SAPARD Programme, NRDP 2007 – 2013*

Introduction

On 1 January 2007, Romania acceded to the European Union (EU). The accession was a late stage demonstration of the Romania's involvement in the process of European integration. It also signaled the acceptance, by the majority of its European partners, of the progress Romania has made in its post-communist transformation from a state owned agriculture to a functioning market economy agriculture.

Reaching a workable agricultural system was has been a long process, which requiered painful reforms and a significant external aid for change. While various aspects of the country's post-communist political and economic development have received much scholarly attention, the academic analysis of Romania's SAPARD programme has been largely confined to occasional papers. Also no connection was done with the following NRDP programme (2007 – 2013) and its impact. (Papa Dimitriou & Phinnemore, 2008, p. 1-2)

Material and Method

In order to correctly identify the effects from SAPARD programme since the year 2000 (the date on which this financial programme was introduced) until the end of 2006 and for the subsequent programme (2007 – 2013) we conducted an analysis based on national statistics data, as available in the official reports.

This paper is based on a rich bibliographical study, where we have used information from the national reports of various agencies in the area (NIS), speciality papers and National strategies for rural development

European mechanisms and support instruments within the pre-accession period. The SAPARD Case

It is in the pre-accession context that the European Commission envisaged the creation of SAPARD Programme - a financial instrument offered by the European Union to help the candidate states (the countries which have submitted their application request to the European Union) in the pre-accession process in the area of agriculture and rural development.

The SAPARD Programme was seen as a lifeline for the Romanian agricultural system as it provided the much needed know-how and financial resources Romania's agriculture badly needed.

„The support granted by the Community for the period 2000-2006 through the SAPARD programme shall focus upon the actions destined to contribute to reaching the following general objectives proposed for the SAPARD programme: the implementation of the acquis communautaire concerning the common agricultural policy and related policies, protect the environment and policies related to the alimentation area and the regulations regarding consumer protection public health, animal and plants welfare and health;

This objective of Romania's strategy for EU integration for the agricultural sector, food industry, aquaculture and rural development is represented by the implementation of the acquis communautaire[i].

In a way Romania has outsourced its agricultural reforms by offering to the external bodies the tools and powers to regulate its reform dynamics, thus providing a way for local politicians to escape future political costs by pointing finger toward Brussels and omitting the fact that such a reform was badly needed especially due to the structural problems of the Romanian agriculture.

"The main factor that was decisive in the end to impose the rural development on the Romanian government agenda was the need for convergence with the EU policies, including the programming and the implementation of the **S**pecial **a**ccession **p**rogramme for **a**griculture and **r**ural **d**evelopment (SAPARD) of EU. As a notable element, we need to retain that there was no department for rural development within the framework of Agriculture and Forests Ministry before the beginning of SAPARD programming".[ii]

Unlike the other states that have become EU members in 2004, Romania's structural problems were much more acute. The excessive fragmentation of agricultural lands is a problem where EU cannot directly intervene, but only through the elaboration of programmes that could support the land concentration. Also, in Romania, in the pre-accession period, the number of subsistence farms and semi-subsistence was very big, a thing that persists even nowadays. Another dysfunctionality of Romania's agricultural sector was the big number of older farmers. A final structural aspect that is problematic was represented by the food industry, insufficiently developed in order to ensure a market for basic agricultural products.[iii]

The evaluation of the SAPARD funds implementation in figures

At the end of 2009, the total amount committed was EUR 1,354.929 for the entire Programme, resulting a commitment rate of 89.06% as compared to 2000 – 2006 allocations.

As regards the executed payments, by 31st of December 2009, the total amount is MEUR 1,348.016, resulting a consumption rate of 88.60% as compared to the 2000 – 2006 allocations[iv].

For the 10 measures accredited under SAPARD Programme, during 2009, the implementation of the contracted projects was continued by executing a number of 479 payment instalments to the beneficiaries of the SAPARD Programme reaching a total value of MEUR 69.272.

At the end of 2009, the total value of the financial commitments under SAPARD Programme was of MEUR 1,354.929, resulting in a coverage degree of 100% of AFA for 2000 – 2005 and of 32.04% for AFA 2006. As regards the consumption rate of the allocated funds, at the end of 2009, the total value of the payments executed to the beneficiaries of the SAPARD Programme was of MEUR

1,348.016, representing a consumption rate of 100% of AFA for 2000 – 2005 and of 29.22% for AFA 2006[v].

Until December 31st 2009, 4.316 projects were approved with a public value of MEUR 1,279.214, on the investment measures. Out of these projects 10.57% represent contracts under Measure 1.1, 0.46% represents contracts under Measure 1.2, 17.70% represent contracts under Measure 2.1, 44.11% are projects contracted under Measure 3.1, 0.07% are projects contracted under Measure 3.2, 0.02% are projects contracted under Measure 3.3, 24.44% are projects contracted under Measure 3.4 and 2.62% are projects contracted under Measure 3.5.[vi]

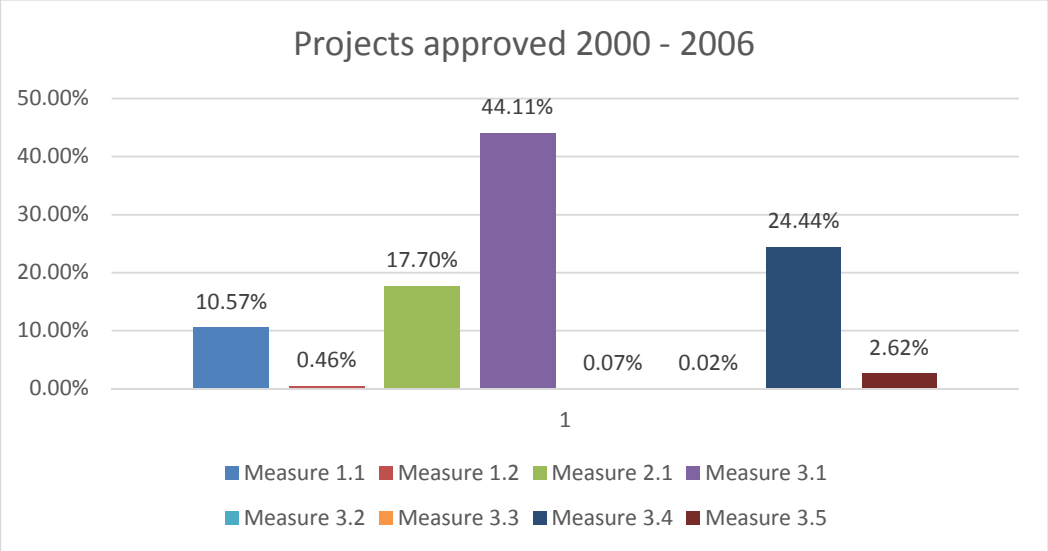

Figure 1: Projects approved during 2000 – 2006 (in %)
Source: Own calculus based upon *** *Final Report on Sapard Programme implementation in Romania* (2012), p. 199, available online at http://old.madr.ro/pages/dezvoltare_rurala/sapard/final-report-sapard2012-en.pdf Last visited on March 27th 2016

The public contracted value, afferent to the contracts on:

- ✓ Measure 1.1, was of MEUR 331.350, representing 25.90% out of the total commitments of the PARDF.
- ✓ Measure 1.2 the public contracted value was of MEUR 33.698 i.e. 2.63% out of the total commitments of the PARDF.
- ✓ Measure 2.1, the public contracted value was of MEUR 561.250 i.e. 43.87% out of the total commitments of the PARDF.
- ✓ Measure 3.1, the public contracted value was MEUR 223.405 i.e. 17.46% out of the total commitments.
- ✓ Measure 3.2, the public contracted value was MEUR 0.075 i.e. 0.01% out of the total commitments.
- ✓ Measure 3.3 the public contracted value was MEUR 0.014 i.e. 0.001% out of the total commitments.
- ✓ Measure 3.4, the public contracted value was MEUR 66.336 i.e. 5.19% out of the total commitments of the PARDF.
- ✓ Measure 3.5 the public contracted value was MEUR 63.08 i.e. 4.93% out of the total commitments[vii].

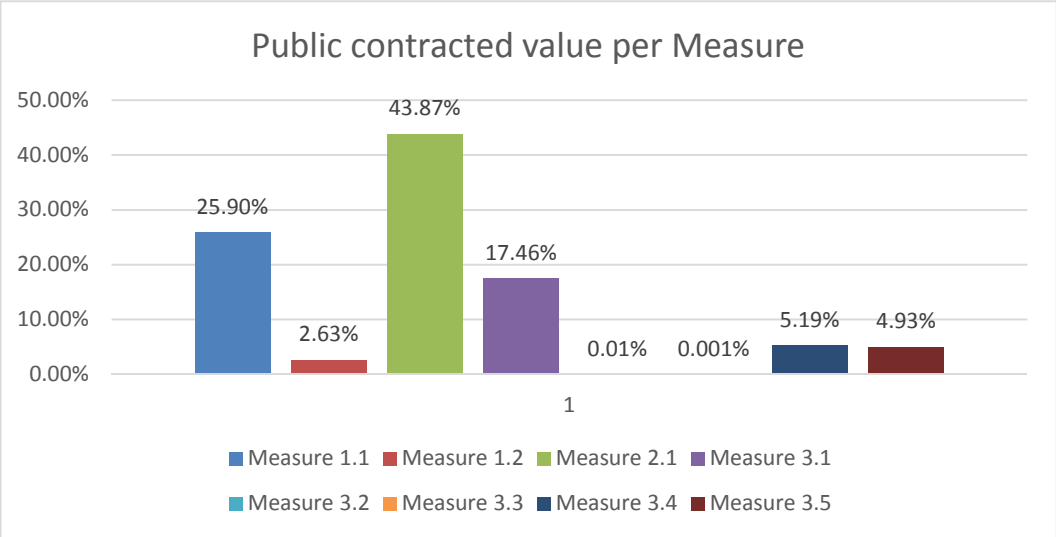

Figure 2: ***Public contracted value per Measure (in %)***
Source: Own calculus based upon *** *Final Report on Sapard Programme implementation in Romania* (2012), p. 200, available online at http://old.madr.ro/pages/dezvoltare_rurala/sapard/final-report-sapard2012-en.pdf Last visited on March 27th 2016

At the same time, by 31st December 2009, a number of 120 projects affected by natural disasters were approved, with a total public value of MEUR 71.439 on the investments measures. Out of these projects, 2.50% represented contracts on Measure 1.1, 69.17% represented contracts on Measure 2.1 and 25.83% represented contracts on Measure 3.1, respectively 2.50% were projects contracted on Measure 3.4.[viii]. The importance of the projects affected by natural disasters is given by the fact that they prove the real local need for this type of projects and the fact that the beneficiaries have done their best to have the projects succeeding. Moreover it is important to know, if we speak about a reduce absorption rate, that not all the projects were delayed due the low skills of those in charge or due to system problems but due to natural causes.

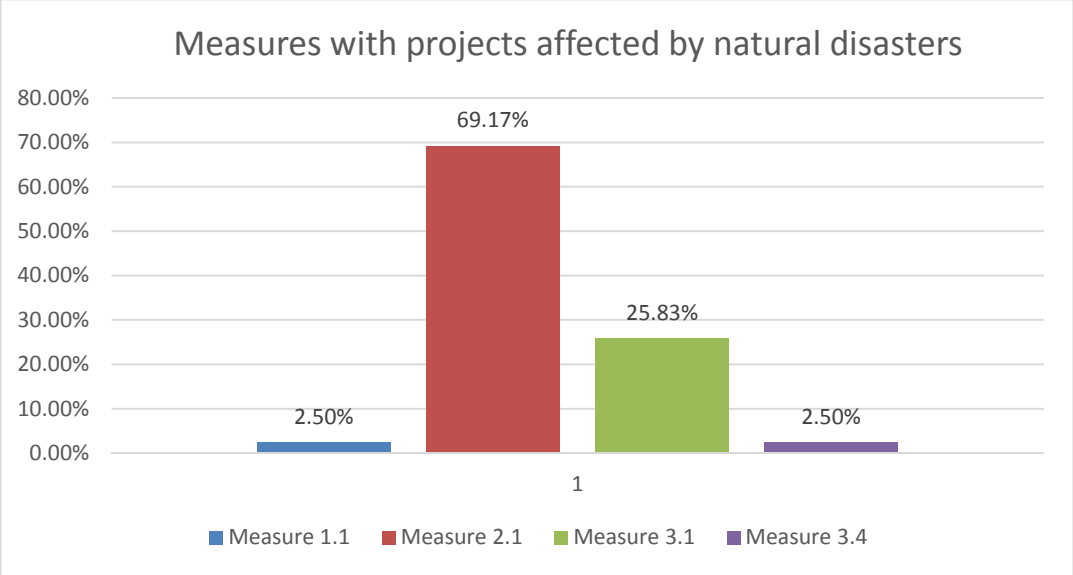

Figure 3: ***Measures with projects affected by natural disasters***
Source: *** *Final Report on Sapard Programme implementation in Romania* (2012), p. 199 - 200, available online at http://old.madr.ro/pages/dezvoltare_rurala/sapard/final-report-sapard2012-en.pdf Last visited on March 29th 2016

The contracted public value afferent to the contracts affected by disasters on Measure 1.1 was of MEUR 6.057, representing 8.48% from the total PARDF commitments. On Measure 2.1, the public contracted value was of MEUR 57.817, respectively 80.93% from the total PARDF commitments. On Measure 3.1, the public contracted value was of MEUR 7.133, respectively 9.98% from the total commitments and on Measure 3.4, the public contracted value was of MEUR 0.432, respectively 0.60% from the total PARDF commitments.[ix]

By December 31st 2009, 4,374 projects were finalized, out of which 450 on Measure 1.1, out of which 3 finalized projects being projects affected by natural disasters, 19 projects were finalized on Measure 1.2, 843 projects were finalized on Measure 2.1 out of which 83 finalized projects being projects affected by natural disasters, 1,916 projects on Measure 3.1 out of which 31 finalized projects being projects affected by natural disasters, 1,018 projects on Measure 3.4, out of which 3 finalized projects being projects affected by natural disasters, 113 projects on Measure 3.5, 5 projects on Measure 4.1 and 10 projects were finalized on Measure 4.2.

Out of 4,374 projects, 409 projects were finalized in 2009 as follows: 20 projects under Measure 1.1, 13 projects under Measure 1.2, 94 projects under Measure 2.1, 109 projects under Measure 3.1, 116 projects under Measure 3.4, 57 projects under Measure 3.5.[x].

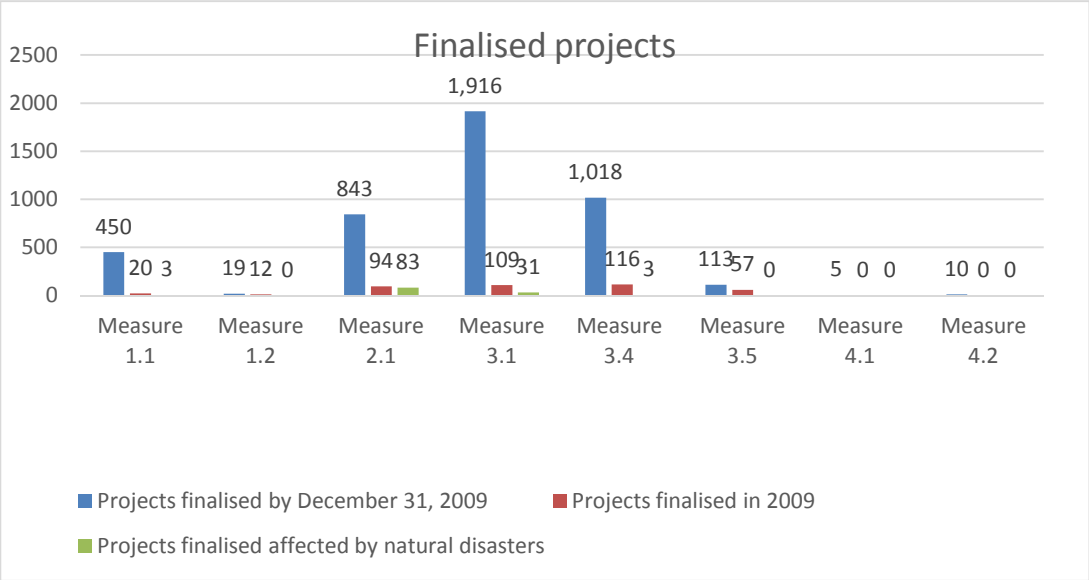

Figure 4: *Finalised projects*
Source: *** *Final Report on Sapard Programme implementation in Romania* (2012), p. 211, available online at http://old.madr.ro/pages/dezvoltare_rurala/sapard/final-report-sapard2012-en.pdf Last visited on March 27th 2016

The Romanian agricultural system 2007 – 2013. Evolution of communitarian support (in numbers)

At the end of the SAPARD Programme, the agriculture remained one of the most important branches of the Romanian economy with a contribution at the current GDP of approx. 6%. The weather conditions as well as the economic crisis generated fluctuations with a growth period in 2008 – 2013, interrupted in 2010 and 2012.

As regards the Community support the payments done in 2007 – 2014 period had a total of 9.09 billion EURO out of EAGF, EAFRD and the national budget, payments that prove and absorption rate of 81,17%. This is the reason why in the following pages I have done a a chart of the Communautarian asistance for the two pillars at Romania's level 2007-2013/2014.

Evaluation of community support trough Pillar I

The EU budget direct payments for which Romania was eligible went from 440 millions in 2007 (25% of the negotiated value) to 1.766 millions in 2016 (total amount). The used agricultural land is of 7.012.666 hectares and we add 2 millions hectares of grass land, thus resulting an elligible surface of 9 million hectars. UAA registered in Farms Register in 12th May 2006 was of 8.925.802 hectares[xi].

Table 1. Evolution of direct payments on surfaces during 2007-2014

year	Per surface direct payment value (SAPS+ PNDC 1)		SAPS		PNDC 1	
	euro	%	euro	%	euro	%
2007	97.55	100	50.55	100	47	100
2008	107.5	110.159	60.75	120.18	46.7	99.38
2009	115.8	118.667	71.12	140.69	44.6	94.98
2010	131	134.290	80.36	158.97	50.6	107.74
2011	133.1	136.453	100.7	199.11	32.5	69.06
2012	154.7	158.544	119.7	236.72	35	74.47
2013	160.2	164.193	139.2	275.31	21	44.68
2014	176.7	181.138	156.9	310.37	19.8	42.15

Source: APIA 2008-2015 Reports[xii]

Between 2007 and March 31st 2015 payments were done of approximatebly 7,33 billion EUROS from EAGF. If we report this at the allocated financial cellings we have an annual absorption rate of over 98%. This high absorption rate proves that the Romanian farmers are interested in accession the European funds, but also that the money they receive have contributed to their development[xiii].

Within the multinual financial framework 2007 – 2014 Romania had for EAGF a total of 11,82 billion euros, out of which 7,8 billion euros went to direct payment schemes, market measure and interventions financed trough EAGF and 3,02 billion euros destined to implement measures 211, 212, 214 and animal welfare (measure 215)[xiv]

At the end of 2013, in accordance with the official measure 68,12% of EAGF were absorbed in the analyzed period .

The total amount that APIA has done during 2007-2014 was of 9,09 billion euros of EAGF, EAFRD, national budgetin order to cofinance the support measures which elad to an absorption rate of 81,17%.[xv]

Table 2. Financial balance of Romania in relation with the European Union for CFM 2007-2015

Amounts received from the EU budget	Done 2007	Done 2008	Done 2009	Done 2010	Done 2011	Done 2012	Done 2013	Done 2014	Done 2015	Done 2007-2015at 31.03.2015
EAGF (billion euros)	0.01	0.46	0.58	0.66	0.77	0.99	1.17	1.33	1.28	7.25

Evaluation of community support trough Pillar II

For the period analyzed in accordance with the provisions of the National Plan 2007-2013, Romania received from the European Commission of a financial support for the Pillar II of 8.022.504.745 euro, which represented 80,46% of the total public contribution.

Table3. Total public contribution according to NRDP 2007-2013, version from February 2008

Axis	**NRDP 2007-2013 –Approved versions February 2008**			
	Total public contribution			
	Total public contribution euro	**Contribution rate EAFRD (%)**	**EAFRD Amount 2007-2013 euro**	**% of total allocated to EAFRD**

Conclusions

These 2 programmes have significantly contributed to the improvement of living standards in the rural area through investments in the rural infrastructure and by creating new possibilities of obtaining alternatives revenues. Also the funds granted to Romania in the pre-accession period have made the rural area to be a place with much better living conditions in comparison with the alternative where wouldn't have existed the financial support for eligible investments trough SAPARD and NRDP 2007-2013.

Another great advantage of these programmse was that it allowed to draft a real-time image of the deficiencies that any financing programme would encounter:

- the concentration, in the beginning of the programming period, of almost all activities at central level and the late setting up of an institutional framework adequate for ensuring the efficiency of implemented activities;
- rigid implementing procedures, the large amount of supportive documents solicited to applicants as well as their insufficient counseling by competent authorities lead to a difficult application submitting process;
- the long procedural dead-lines for the evaluation and selection of projects and authorization of payments;
- the low information level among the general public due to the insufficient publicity regarding the Programme's contents;
- the difficult access to consultancy services for projects elaboration and implementation, their high cost and many times lack of quality, together with the low functionality level of the National Agricultural Consultancy Agency;
- the high cost of credits needed for co-financing in the general context medium rentable agricultural and agricultural related activities, as well as the lack of guarantees for accessing these credits especially for small and medium enterprises and small farmers;
- the lack of interest and of viable strategies among commercial banks and other types of crediting bodies regarding agriculture and rural development financing;
- due to the existing economic down point, the economic actors registered state debts which blocked access to SAPARD financing;
- difficulties in proving ownership or usage rights concerning immovable goods (land, constructions facing modernization) due to on-going legal regulation of property and instability in this field which lead to numerous legal trials.[xviii]

A Review of the Nigerian Economy from the Oil Windfall Perspective

Nicoleta Acomi, PhD. Assoc. Professor, Constanta Maritime University, Constanta, Romania, nicoleta.acomi@cmu-edu.eu
Ovidiu Acomi, Marine consultant, Constanta Maritime University, Constanta, Romania, ovidiu.acomi@gmail.com

Abstract

Independent state since 1960 and member of OPEC since 1971, Nigeria is the largest oil producer in Africa and in 2014 exported in excess of 2.1 million bbl/d oil and 26 billion m^3 of natural gas. Globally, Nigeria ranks among the top five liquefied natural gas exporters and is the 9th exporting country. The oil and gas industry generally accounted for 75% of the government revenues and 95% of countries export revenue. This paper proposes to investigate evidence supporting the analytical concepts associated with oil windfall, which changed the predominantly agricultural Nigerian state into a major oil producing country. The aim is to critically analyse the oil windfall's impact on the structure and evolution of the Nigerian economy since 1960.

Keywords: Nigerian economy, windfall perspective.

Introduction

Although blessed with large non-renewable resources, Nigerian economy underperformed when compared with the resource-poor countries like Japan, Korea and Taiwan, (Sachs and Warner 1997). The Nigerian paradox of plenty (Adedokun 2012) is described by Auty (1993) as the resource curse. This curse is substantiated by Nigeria's GDP per capita (in constant 2000 dollars) which stood at USD 430 in 2004 compared to USD 444 in 1977 (World Bank 2010), despite periods of GDP growth (Figure 1).

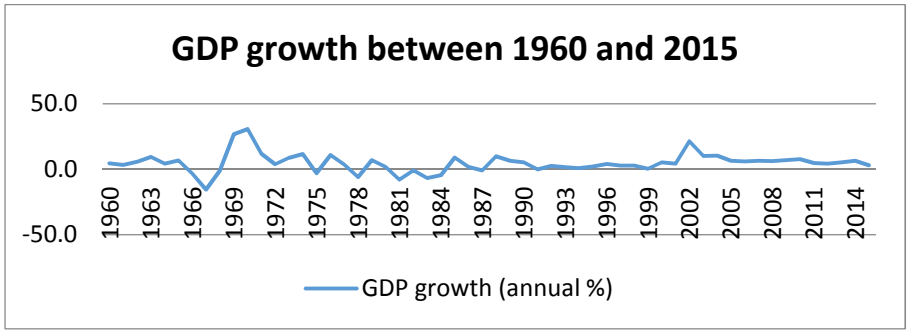

Figure 1: Nigerian GDP Growth during the period between 1997 and 2006, Source: The Conference Board (2015)

The poor performance contrasts with Nigeria's potential to make its mark as an emerging power and lift from poverty 80 million people by 2030 (National Intelligence Council 2012). Ramdoo (2012) argued that natural resources are not a curse, but rather the inability to translate natural resources into sustainable wealth.

The government's inability may be explained by the perverse effect of the oil rents on the political, economic and social environment. The rentier state theory (Mahdavy 1970) clearly applies to Nigeria (Mahler 2010), which in 2005 derived 70% of budget revenues and 95% of total exports from the oil and gas resources (The World Bank 2010).

The oil rents weakened the manufacturing sector and delayed formation of a strong middle class as foundation for democracy, having a stabilising effect on authoritarian rule (Ross 2004). The governments

maintained power by establishing low taxation regime for population, poor tax collection, energy subsidies, patronage networks and clientelism. These resulted in economic inefficiencies and impeded the overall socio economic development. Along with the political regime, the overall socio economic situation resulted in rent seeking behaviour (voracity effect) and weak government institutions not able to maintain political stability (Sala i Martin and Subramanian 2003).

Authoritarian civil and military rulers expanded government spending on security forces to maintain power and repressed political opposition (Mahler 2010), although Ross (2003) suggested that the Nigerian military spending remained lower compared to other African States.

Oil Windfall and Resource Allocation

According to Mahler (2010), the focus of Nigerian rulers was on maintaining authoritarian power, rather than violence, although violent conflicts escalated in Nigeria in the '70s and '80s. Collier and Hoffler (2002) suggested that Nigerian oil was a motive for conflict escalation because of rebels' temptation to take control of natural resources. In addition, the present poor Nigerian society believed that present poor generations should benefit from the resource windfall because they pay the social and environmental costs (Mahler 2010). The population's frustration reflected in theft and subsequent reduction of total oil production which decreased Nigeria's export revenues (Figure 2).

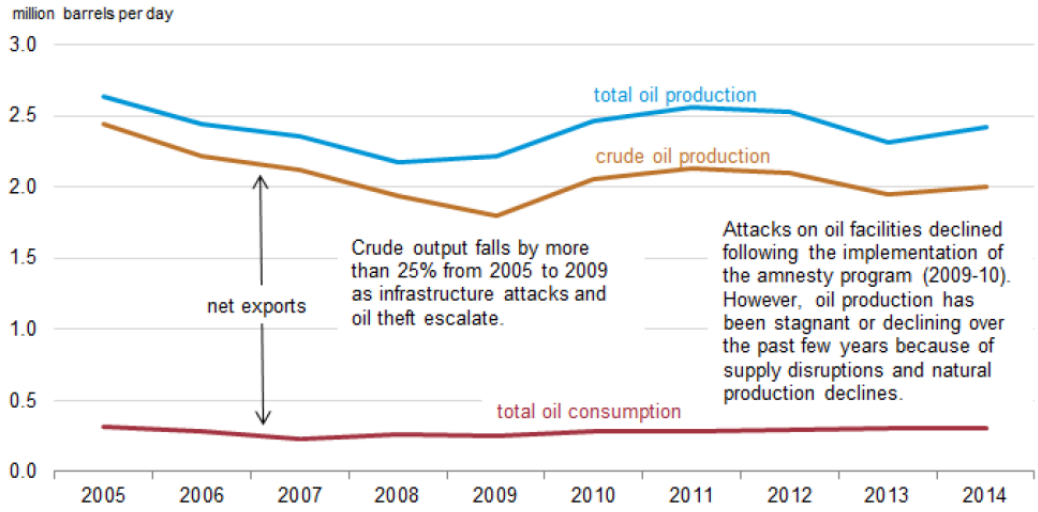

Figure 2: Petroleum and other liquids production and consumption in Nigeria, Source: EIA (2015) p. 5

Despite the high country risk, the risk-return balance remained positive, making Nigeria attractive for global investors (Figure 3).

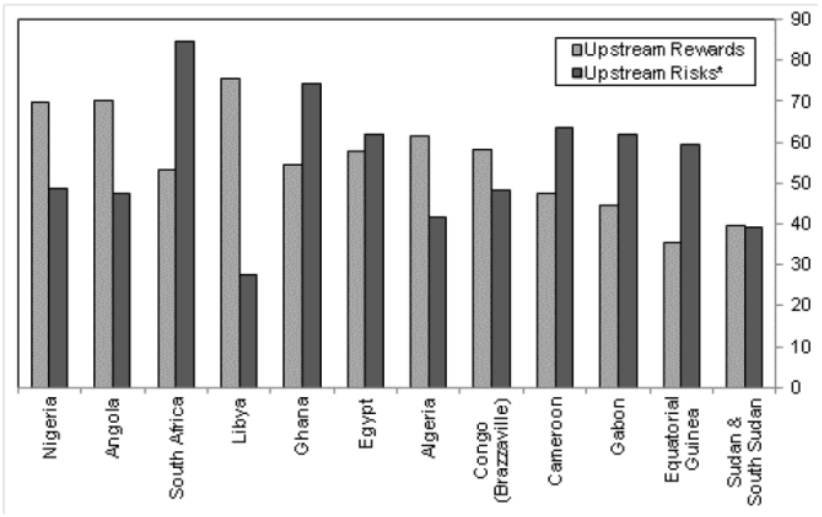

Figure 3: Upstream reward and risk scores on a 0 to 100 scale, Source: Business Monitor International (2013) p. 94

Nigeria needed foreign investments because the economy had scarce capital resources. The challenge was the resource management and the associated prioritisation of government policies. Baunsgaard et al (2012) suggested macro stability and development as Nigeria's priorities.

The challenge is depicted by the options ahead (Figure 4), concerning fiscal regime, government spending and investments and the management of the structural change associated with a potential foreign exchange windfall.

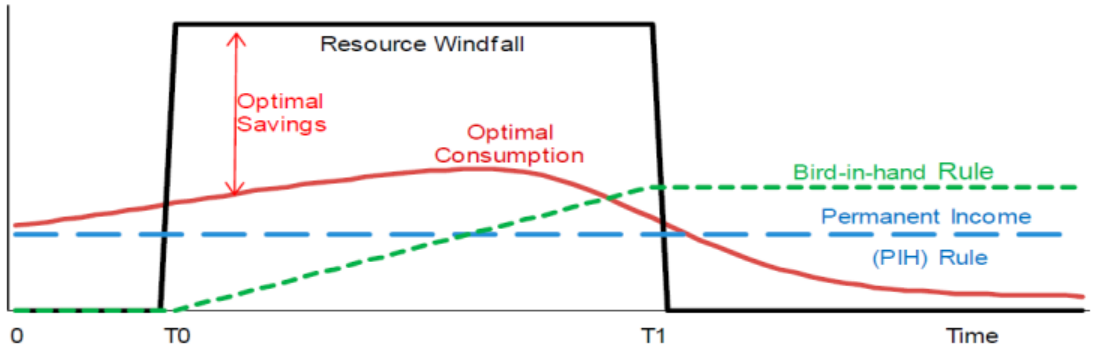

Figure 1: Incremental consumption from a resource windfall, Source: IMF (2012) p. 11

The above model refers to temporary resource windfall compared to the rather permanent Nigerian oil resources, but applies to the Nigerian case because the volatility of oil prices (Figure 5), which triggered revenue volatility.

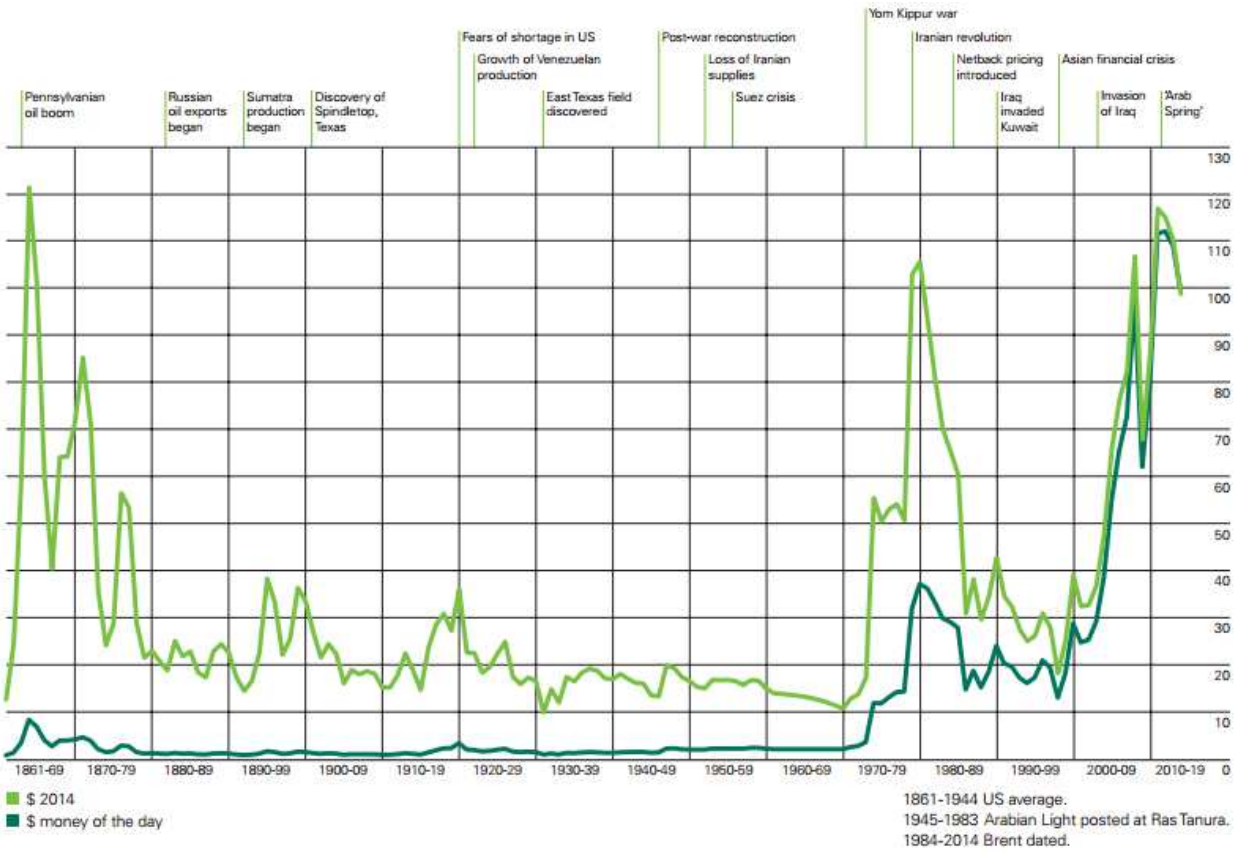

Figure 5: Crude oi prices 1861-2014 (USD/barrel), Source: British Petroleum (2015) p. 15

The revenue uncertainty (Figure 6) required resource allocation between consumption, domestic investment and financial savings (Van Der Ploeg and Venables 2010).

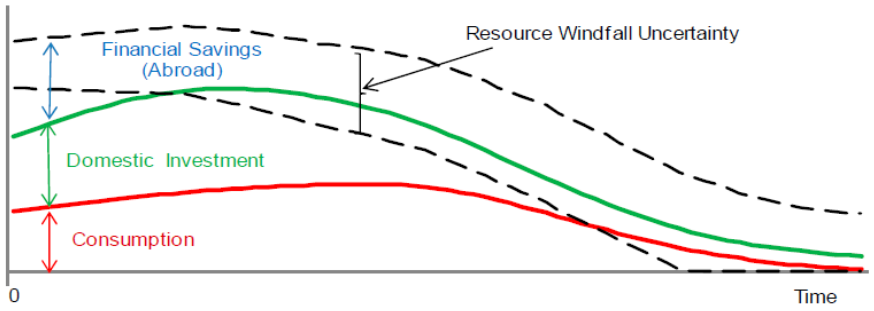

Figure 6: Incremental consumption and saving/investment from an uncertain resource windfall, Source: IMF (2012) p. 15

Nigeria adopted different macroeconomic approaches during the analysed period. During the early 1970s, the oil windfall surpluses were saved and invested abroad.

Given the potential of the Nigerian economy depicted by strong demographic growth and relatively weak development of the country in terms of infrastructure and GDP per capita, the government approach after 1974 was to flood the oil revenue into the Nigerian economy by increasing government expenditures during oil price hikes. This in turn determined large foreign exchange inflows which led to appreciation of the real exchange rate (RER), resulting in Dutch Disease (Van Der Ploeg 2011). The latter, together with the rent

seeking behaviour, determined a reduced economic growth of the non-oil sector (Figure 7), because commodities became too expensive for external markets following Naira's appreciation (The World Bank 2005).

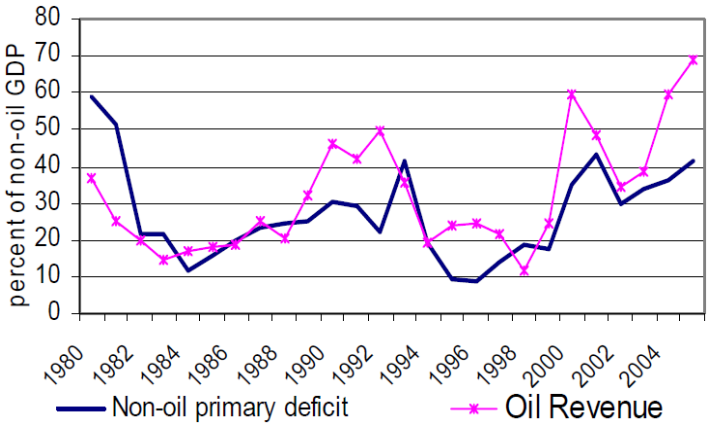

Figure 7: Trends in Non-oil primary deficit and Oil revenues, Source: Budina, Pang and Wijnbergen (2007) p. 7

The fall of oil prices during the early 1980s found Nigeria unable to realise satisfactory returns on the previous investments and to cut down its government spending. Nigeria consumed its foreign reserves and increased of net public debt (Figure 8) by lending from the international capital markets.

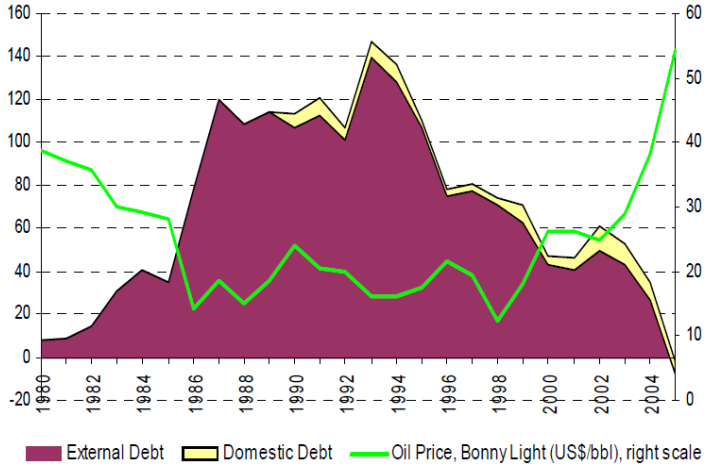

Figure 8: Oil Price and Net Public Debt (% of GDP), Source: Budina, Pang and Wijnbergen (2007) p. 6

As shown above, Nigeria was vulnerable to crude oil prices drop as it had already shrunk its agriculture and mining and became increasingly dependent on oil revenue (Figure 9).

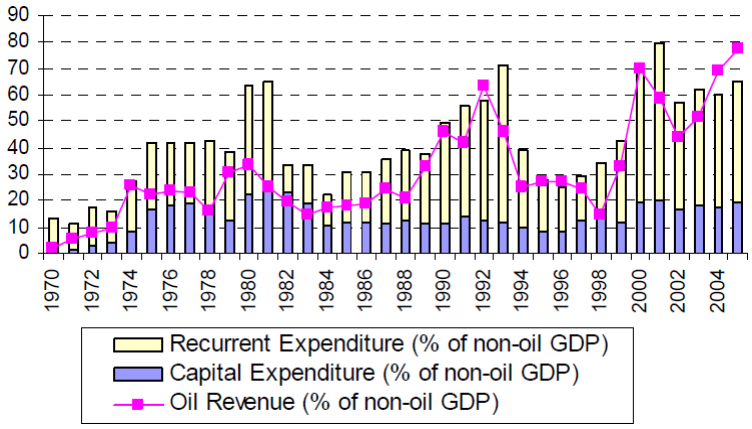

Figure 9: Expenditure and Oil Revenue (% of non-oil GDP), Source: Budina, Pang and Wijnbergen (2007) p. 5

During 1984-1993, the public debt to GDP ratio increased to 140%, primarily as a result of the exchange rate depreciation in 1986. During this period Nigeria faced a debt overhang problem, as the low oil prices determined the devaluation of the resource collaterals, undermining the credit quality of the new debt (Budina, Pang and Wijnbergen 2007). Nigeria was forced to restructure its sovereign debt (Das, Papaioannu and Trebesch 2012), which worsened the country's risk rating.

The volatility of oil revenue was the source of Nigerian macroeconomic instability. Instead of smoothing the effect of oil revenue volatility, the Nigerian policies amplified the macroeconomic volatility (Figure 10) because of the pro-cyclic government spending which included "White Elephants" projects.

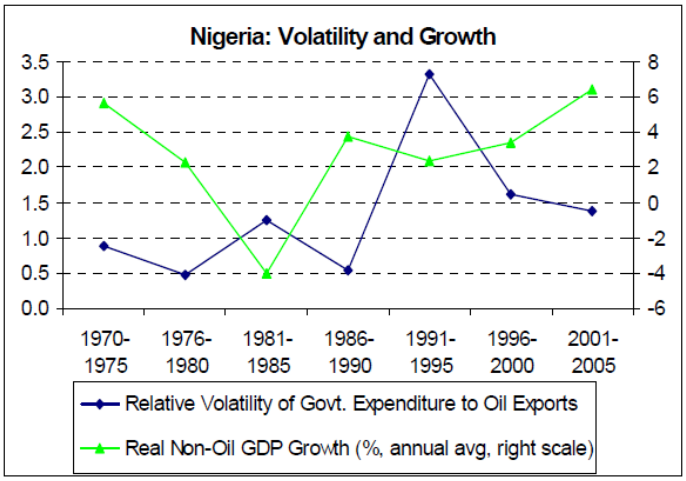

Figure 10: Expenditure volatility and Growth, Source: Budina, Pang and Wijnbergen (2007) p. 15

The economy picked up again after 2000, contemporaneous with the increase of oil prices. Nigeria began to park some of the windfall by establishing a sovereign wealth fund (SWF) and the oil price based fiscal rule (The World Bank 2005). The 2004-2007 period was characterised by coordination of fiscal, monetary and exchange rate regime and limited spending (Figure 11). This saving policy resulted in the reduction of the gross public debt to 31% of GDP in 2005.

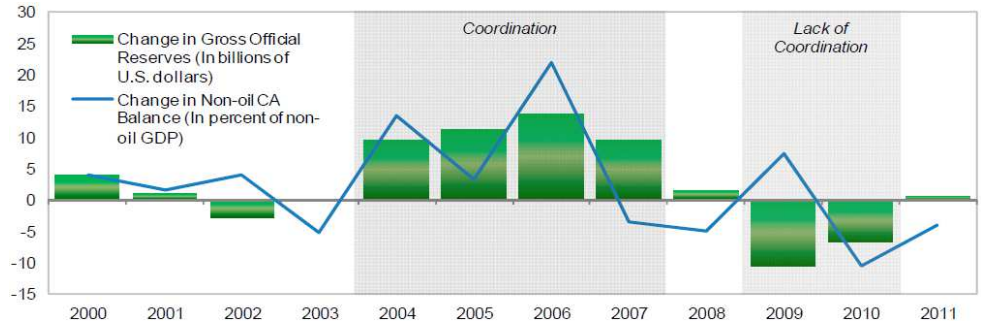

Figure 11: Nigerian external balance, Source: IMF (2012) p. 34

However, during this oil windfall period, the consolidated public expenditure continued to rise (Figure 12).

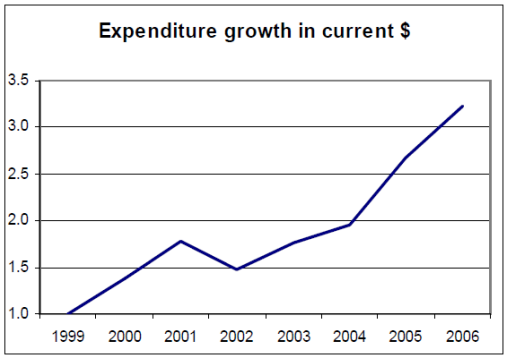

Figure 12: Growth in consolidated expenditure in USD, Source: Budina, Pang and Wijnbergen (2007) p. 9

In 2009-2010 the oil price rule and the stabilisation fund lost traction, leading to a lack of coordination (Figure 13).

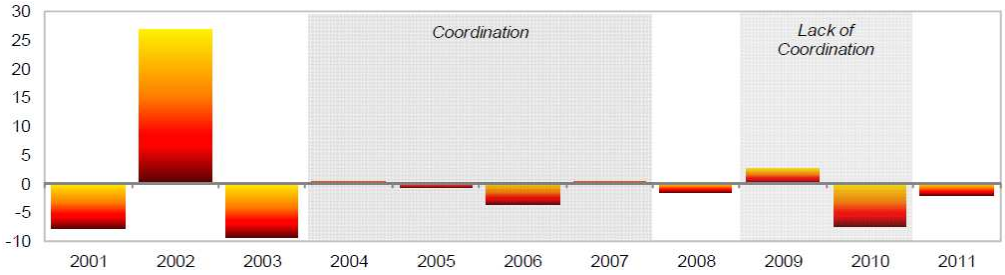

Figure 13: Change of non-oil primary balance (percentage of non-oil GDP), Source: IMF (2012) p. 34

By the end of 2013, the Excess Crude Account and SWF declined to USD 3 billion (IEA 2015) contemporaneous to high oil prices, showing the return to pro-cyclical approach.

Conclusions

During the analysed period, the structure of the Nigerian economy changed following the oil windfall. Nigeria became increasingly dependent on oil revenue and developed into a rentier state. The oil rents shaped the Nigerian political, economic and social environment. On the political side, oil rents had a stabilising effect on authoritarian rule. This was maintained by establishing low taxation regime for

population, poor tax collection, energy subsidies, patronage networks and clientelism, which impeded the socio economic development and led to economic inefficiencies. Social inequity triggered violent conflicts which decreased oil production and raised the country risk.

Even so, Nigeria remained attractive to foreign investors and had to manage the oil resources and capital inflows to achieve macro stability and development. The consumption, domestic investment and saving ratio were affected by the volatility of oil prices. Generally Nigeria adopted pro-cyclical measures by accelerating spending and investment during periods of high oil prices which lead to appreciation of the RER resulting in Dutch Disease, which suffocated the non-oil sector. The oil price downturns led to depreciation of Nigeria's collaterals, high interest borrowings and debt overhang.

Although Nigerian economy grew during the analysed period, the rate and sustainability of growth pose the question whether the oil windfall was a curse, rather than blessing.

Abstract

Starting from the Satellite Accounts System for Romania, other types of satellite health accounts may be developed, involving a rearrangement of the central classifications and a possible introduction of complementary elements. Health expenditures on different types of services, different types of health care providers, and according to financing source could be analyzed on sex and age groups. Age groups derive from the differentiation of the health services provided in the Romanian hospitals (0-1 years, newborns; 1-18 years, children; 18-65 years, adults; 65+, aged and old people). Health expenditures could be also analyzed relatively to the development regions of Romania. All these models of satellite health accounts that we suggest need highly specific and complex data for compilation, which can be achieved by specialized institutions such as the National Statistics Institute (and its branches) and other authorized institutions that have access to, and use on a regular basis the necessary data. Statistic data have not yet been published for such satellite account models.

Keywords: health satellite accounts, health expenditures, Romania.

Introduction

Values movement is universal, being present in enterprises, institutions, business groups, at the national and the international level. That is why we need to extend accounting calculations from the micro-economic level to the macro-economic level as stated by Tabără (2008).

Using statistics tools and data, The National Accounting System or The National Accounts System (SNA) aims at creating a complete digital representation of the national economy which, however, is sufficiently simplified to extract its fundamental aspects used particularly to achieve the forecast. Dobroţeanu and Feleagă (2004) observed that is obvious that besides the role the national accounts system plays to reflect the past activity and to help better understand the present economic phenomena, its side that allows exploring the future through forecasting, planning and economic policy is essential.

In June 2006 the European Council invited the European Union and its member states to extend the national accounts to the key issues of the sustainable development. Therefore, national accounts must be supplemented with integrated accounting which provides fully coherent data.

Use of Satellite Accounts

For some specific needs in terms of data, the best solution is to use separate satellite accounts. Satellite accounts can serve such data needs providing further details where necessary while removing unnecessary ones. They can extend the accounting framework by adding non-monetary information, such as information on pollution or environmental assets. They can change some basic concepts, extending for example the concept of capital formation, while introducing the expenditure on research, development or education as stated by European Parliament (1997).

Separate satellite accounts seem to be the best solution when it comes to certain specific data needs. The satellite accounts provide the opportunity of making connections between non-monetary statistics and the standard framework of the national accounts. In 2010, Costuleanu underlined that this link is possible if the classifications applied in the standard framework are used for these monetary statistics whenever there is a need for it.

When designing and compiling a satellite account, applying the concepts of the main framework for a specific purpose often results in the discovery of certain characteristics. From the point of view of their aim, these characteristics may be helpful, but they can also present previously unforeseen limitations.

Turning a satellite account which observes the main framework into a product meant for the data users may involve further stages. It is, however, possible to insert a general table with key indicators for several years. These key indicators might focus on the description of the size, the components and the development of the specific aspect involved, or may highlight the links with the national economy and with its major components. Further details and classifications which are relevant politically and analytically may also be added. Low added value details, or those whose compilation involves rather high costs, may be given up. Also, sustained efforts are needed to diminish the complexity of the tables, to increase the degree of simplicity and transparency for data users while certain standard accounting lay out details should be inserted in a separate table as suggested by European Parliament (2010).

The emphasis on the flexibility of the national accounts system is extended to allow total flexibility in relation to the number and the types of satellite accounts or other types of extended accounts that are being developed. The functional satellite accounts, especially those in the second category, allow new concepts and methods which are characterized by a higher degree of freedom than those in the main national accounts system, to be experimented. When a number of countries develop similar satellite accounts, experience exchanges may lead to improvements and to setting international trends in a particular field and, there might also arises the possibility of certain changes even within the central system as stated in 2008 by European Commission and partners.

As it has been already mentioned, a first set of satellite health accounts involves a rearrangement of the central classifications and a possible addition of complementary elements. Such satellite accounts may be taken as an extension of the key-sectors. They may be slightly different from the central system, though they do not change the basic concepts of the National Central system in depth. EU (2010) and the OECD-Eurostat-WHO partners (2011) forwarded satellite health account concepts starting from some main general principles, which are to be developed by each country according to their own needs and to the possibilities they have to get them.

Satellite Health Accounts Proposals for Romania

A first and extremely easy health satellite account that could be compiled for Romania is the one given as an example by the European Parliament (2010) and the European Council, that is key-statistics regarding health.

Starting from the Satellite Accounts System for Romania, other types of satellite health accounts may be developed and involve a rearrangement of the central classifications and a possible introduction of complementary elements.

One of the satellite health accounts that holds great informational value is the one that includes the total health expenditures, the current health expenditures and the creation of gross capital, related to the GDP, as well as the percentage of GDP allocated to health care over a time span, i.e. 2003-2009, extended, that we have developed and detailed in previous work by Costuleanu (2013). The variation of the value as parameter is constantly reported to the previous year (t-1).

Health expenditures on different types of services could be analysed on sex and age groups (Table 1). Age groups derive from the differentiation of the health services provided in the Romanian hospitals (0-1 years, newborn; 1-18 years, children; 18-65 years, adults; 65+, aged and old people). Such a classification, on different age groups though, is to be found in SCS 2000 and it refers strictly to the levels of household expenditures on health care as presented by OECD in 2000.

All these models of satellite health accounts that I suggest need highly specific and complex data for compilation, which can be achieved by specialized institutions such as the National Statistics Institute (and its branches) and other authorized institutions that have access to, and use on a regular basis the necessary data. Statistic data have not yet been published for such satellite account models.

Another way of detailing health expenditures as satellite accounts (that are recommended) is that dealing with different types of health care providers and that on age and gender groups (Table 2). Likewise, age groups derive from the specific provision of health care services in Romanian hospitals (0-1 years, newborn; 1-18 years, children; 18-65 years, adults; 65+ years, aged and old people).

Table 1: Satellite account model detailing the health expenses (millions RON, current prices) on types of services and on age and gender groups

Age groups / **Gender** / **Types of services**	**0-1 years**		**1-18 years**		**18-65 years**		**65+ years**	
	M	**F**	**M**	**F**	**M**	**F**	**M**	**F**
Curative and rehabilitation services								
Curative services								
Rehabilitation services								
Curative and inpatient rehabilitation services								
- Inpatient curatives services								
- Inpatient rehabilitation services								
Ambulatory curative and rehabilitation services								
- Ambulatory curative services out of which:								
Primary care and diagnosis services								
Ambulatory stomatology services								
Other specialised curative services								
Other ambulatory curative services								
- Ambulatory rehabilitation services								
Long term care services								
Inpatient long term care services								
Home assisted long term care services								
Ancillary care services								
Laboratory services								
Ambulance and non-emergency medical transportation services								
Other ancillary services								
Medical supplies provided to ambulatory patients								
Medicine and other non-durable medical supplies, out of which:								
- Drugs on prescription								
- Other non-durable medical supplies								
Therapeutic devices and other durable medical supplies, out of which:								

- Glasses and other vision devices								
- Orthopaedic and prosthetic devices								
- Hearing aids								
- Walking devices, including wheelchairs								
- Other durable medical devices								
Prevention and public health services								
Mother and child health, planning and family counselling								
School health services								
Prevention of communicable diseases								
Prevention of non-communicable diseases								
Other public health care services								
Health care management and health insurance services								
Public health management (excluding social security)								
Management, Operation and support activities of social security funds								
Non-specified medical services								
Current health expenditures								
Capital formation in the case of health care services providers								
Total health expenditures								
Research and development in health care								
Sanitary control (food, hygiene and drinking water)								
Environmental hygiene								
Management and provision of pecuniary benefits for health care								
The total of the pharmaceutical products and other non-durable medical supplies (those provided to inpatients included)								

This category also includes the detailing of the expenditures according to financing source and age and gender groups (Table 3). Age groups also derive from the specific provision of health services in Romanian hospitals (0-1 years, newborn; 1-18 years, children; 18-65 years, adults; 65+ years, aged and old people). The health satellite accounts could further link the expenditures on types of services (Table 1), types of health care providers (Table 2), financing sources of health care (Table 3), and Romania's development regions, correlated with the regional GDP, in correlation with Fig 1.

Table 2: Satellite account model: Health expenditures (millions RON, current prices) according to the type of health care providers and according to age and gender groups

Age groups / **Gender** / **Type of health care providers**	**0-1 years**		**1-18 years**		**18-65 years**		**65+ years**

Nongovernmental Organizations (NGO-s) or non-profit institutions								
Corporations (others than health insurance companies)								
Sources that have not been classified somewhere else								
Total current expenditures								

Figure 1: Romania's development regions

As we have already mentioned, all these models of health satellite accounts require highly specific and complex data for compilation, and can be worked out only by specialized institutions such as the National Statistics Institute (and its subsidiaries) and other authorized institutions that have access to and use the necessary data, regularly.

However, the information they would provide be extremely valuable to make health care services more efficient for different age groups, each of them facing specific pathologies, and therefore, specific expenditures as stated by Costuleanu and Georgescu (2011).

At the same time, the above mentioned satellite accounts allow comparisons among various regions of the country, providing information which is useful for the local sanitary policies.

All satellite health accounts of the kind, along with the rearrangement of the central classifications and the introduction of the complementary elements they recommend, are linked to monetary data, being therefore integrated directly with the System of Satellite Account and the System of National Accounts as mentioned by Costuleanu et al (2012).

The second type of analysis based on satellite accounts mainly deals with alternative concepts to those in the SNA. Often, a series of alternative concepts can be used simultaneously. This second type of analysis satellite account may involve, similarly to the first type, changes of the central classifications, but for this second type the main stress falls on alternative concepts. The use of these alternative concepts may generate partial complementary aggregates, whose main aim is to complete the central system, as stated by Costuleanu et al (2011).

This type of functional satellite accounts mainly includes non-monetary data. We can therefore state that one of the main roles of the functional satellite accounts is to make the connection between the monetary data and the non-monetary data.

From the point of view health care services, the gross capital formation concretized in providing medical units with advanced technology medical equipment is highly important. Thus the health

account suggested as a model in Table 2 may be extended with a satellite account related to this aspect (Table 4).

Table 4: Satellite account models: Gross capital formation (%) concretized in furnishing the health care centres with advanced technology medical equipment.

Devices / Types of sanitary units	Devices (scanners) for:		Gamma devices	Devices for:				
	Computed tomography	Positron emission tomo-graphy (PET scanners)		Magnetic resonance (NMR)	Digital angiography (DSA devices)	Shredding kidney stones-litotriptor (LSI devices)	Radiation theraphy (RAD devices)	Mammograms
	% from gross capital	% from gross capital	% from gross capital	% from gross capital	% from gross capital	% from gross capital	% from gross capital	% from gross capital
Hospitals (institutes included, medical centres with hospital facilities)								
Health centres with hospital facilities								
Local health care centres								
Polyclinics								
Treatment and diagnosis centres								
Medical specialty centres								
Specialty ambulatories								
Ambulatory care units integrated to hospitals								
Health centres								
Civil medical societies								
Civil medical specialty societies								
Dental and oral health civil medical societies								

Surgeries (dental and oral health clinics not included)								
Dental and oral health clinics								
Medical laboratories								

Another health satellite account that we propose can be used to analyze the total number of consultations, the number of ambulatory consultations provided to patients, the number of treatments, the number of laboratory tests (paraclinical), the number of treatments per patient per type of healthcare cases, day-care treatments, person/days of hospitalization, the number of sick leave granted, all of them representing non-monetary data. If we add, however, the cost of the treatment per patient or the cost of the paraclinical exams per patient correlated with the current health expenditures then we introduce a link between non-monetary data and monetary data, a characteristic feature of the satellite accounts.

Conclusions

All these models of satellite health accounts that we suggest need highly specific and complex data for compilation, which can be achieved by specialized institutions such as the National Statistics Institute (and its branches) and other authorized institutions that have access to, and use on a regular basis the necessary data. Statistic data have not yet been published for such satellite account models.

An Assessment of Parents Happiness and Awareness of the Effects of Mobile Devices on Children Social Communication Behaviours in Oman

Jalila Al-Balushi, Sultan Qaboos University, Muscat, Oman, jalila_albalushi@hotmail.com

Hafedh Al-Shihi, Sultan Qaboos University, Muscat, Oman, hafedh@squ.edu.om

Abstract

This research aimed to assess the impacts of mobile devices on children's social communication behaviours in Oman. It endeavored to examine parents' awareness of the risks of mobile devices on children, and their happiness about their children uses of the mobile devices. To achieve this, the research carried out an exploratory case study on the Omani parents to assess their perspective on the effects of mobile devices on their children social communication behaviours. A detailed treatment of Parents Awareness and Happiness and their related predictors is presented using advance neural networks analysis.

Keywords: Social Communication, Mobile Effects, Children, Parents.

Introduction

The recent improvements in communication technology have enabled billions of users in the developed and developing parts of the globe to join those already using mobile devices (Mieczakowski et al., 2011). According to the statistics provided by (Stats, 2015) the internet users across the world are now 3,366,261,156 billion. In fact, mobile devices have put a great impact on individuals (example; teens, schools age, youth) to join this technological phenomenon. The usage of mobile devices has almost doubled over the past few years. According to (Statista, 2016) the number of mobile phone users worldwide in 2016 expected to reach 4.61 billion. Oman is one of those developing nations that have a vast penetration in using mobile devices. According to the Telecommunication Regulatory Authority in Oman (TRA, 2015); the total number of mobile subscribers has been 6,428,707 during 2015 in Oman, a figure that is almost double the total number of population.

Nowadays, most children acquire portable devices (example: laptop, smart phone, tablet, etc...) which can easily be connected to the World Wide Web (Buzzi, 2012). A study conducted in the United kingdom shows that almost one- third of the 3-4 years old go online "using a desktop PC, laptop or notebook , 6% go online via a tablet and 3% via a mobile phone". The use of mobile devices has created several problems for the people of different ages. The presence of mobile communication technology has affected the structure of human relationship (Turkle, 2012). "The mobile phones can interfere with human relationships, an effect that is prominent when individuals are discussing personally meaningful topics" (Przybylski and Weinstein, 2013). A mobile device encourages access to applications (Shuler, 2009) anytime and anywhere, which increasingly makes it difficult for parents to (physically) monitor their children's mobile device use (Campbell and Park, 2008). A study conducted by (Ravichandran, 2009) shows that the mobile usage weakens family relationships. Another study done by (Przybylski and Weinstein, 2013)says that the mobile devices have an effect on the quality of face to face interaction. The usage of smart phones has affected the psychological traits including social interaction, anxiety (Lee et al., 2014) . A study done by (Boxer et al., 2015) shows that technology has reduced the growth of children.

Parents are scarcely cognizant of the risks regarding the usage of mobile devices by their children and it is very crucial to make those parents aware of the impacts of mobile devices and internet in particular upon their children's social communication behavior. The parents' ability and willingness to monitor, share and control their children's use of online media has to face many challenges due to the portability of personalized and private nature of smart phones, which is entailed from the normal mobile phones. (Mascheroni and Ólafsson, 2014). In Sweden, young parents, aged between 25-45 years are providing their children with an accessibility to the internet via mobile devices (Holloway et al., 2013). Other studies show that parents are lesser concerned about their younger children using the internet than the older ones (McPake et al., 2010, Wagner, 2013, Brouwer et al., 2011).

More researches are needed to shed light on this issue and to investigate parents' role and perspective. There are many researches that focus on studying the usage of mobile devices by older children and teens, see for example (Holloway et al., 2013) but younger children are under researched especially with the risks associated with the use of mobile devices. Accordingly, this research assesses parents' awareness about the effects of mobile devices on their children's social communication behaviors. It also investigates their happiness of the use of their children of mobile devices. This problem is being viewed from parent's perspective, investigating children aged between (6-12) years.

Literature Review

The use of new electronic media by children and youth has been growing due to the entertainment and communication facilities provided by these devices. (Kirwil, 2011, Lange, 2014) show that the actual use of electronic devices already begins at the age of 7–11. The parents, guardians or the caretakers equip their children with those devices, assuming that these devices support their development, learning process and observation skills (Tomczyk and Wąsiński, 2014). Sometimes the reasons parents provide their children with smart phones is to persuade them to eat (Genc, 2014). There are obviously benefits and risks at the same time. The benefits may overcome the risks, and may not be recognized until years later (Rosenberg, 2013).

There are many risks or negative impacts associated with the use of mobile devices by children. "Cyberbullying" is one of them (Schrock and Boyd, 2008, Levy et al., 2012). Cyberbullying as a term is defined as "attempts to use emotional harm and social embarrassment through the use of instant messaging, email, social media, and text messages via cell phones." (Berson and Berson, 2002, Henson, 2012, Twyman et al., 2010). Another study done by (Mascheroni and Ólafsson, 2014) shows that younger children are exposed to a higher rate of harm (21%). Some other statistics show that the "smartphone users (17%) and tablet users (15%) have a greater experience of any form of cyber bullying than children who do not use mobile devices (8%)". Another study mentions that the social networks are responsible for creating an environment for cyberbullying especially for girls and young children (O'Neill and Dinh, 2015).

Another risk associated with the use of mobile device by children is "sexual messages". Prior studies showed that children are using mobile phone and internet to interact and search for sexual things (Lenhart, 2009, Livingstone, 2011). Sexual messaging can have "unintended consequences" and may result into hurtful or problematic practice for some children (Mascheroni and Ólafsson, 2014). There are also many additional risks related to the use of mobile devices. Some of them are ‘‘happy slapping" (Sieci, 2012, Chan et al., 2012) which means " aggressive or degrading video(s) are taken by a bystander and then forwarded to other people's phones or posted on a website" (Grigg, 2010), ‘‘cyber baiting" (Davison and Stein, 2014, Nixon, 2014) which means "the intention of harassment" (JIOW, 2015), ‘‘hating" (Delgado and Stefancic, 2014), "improper use of media in education" (Chudý et al., 2015, Glassman and Burbidge, 2014), "perilous contacts through the internet" (Blau, 2011), "child grooming" (Nair, 2006). On the other hand, young users of social media use internet not only to communicate with the known people, but also with the unknown, and this could lead to the possibility of sharing sensitive data with them such as: age, location of residence, e-mail address,

personal pictures, profession, hobbies and other confidential information (Tomczyk and Kopecký, 2016).

In this research, the aim is assess the effects of mobile devices on children social communication behaviors\skills. Several studies focused on assessing social communication skills among children with autism or other special needs in general (Hansen et al., 2014, Nesterova et al., 2015, Shukla-Mehta et al., 2009). In order to assess the impacts of mobile devices on children social communication skills/behaviors, Table 1 summarizes and describes the list of social skills and behaviors found from the literature.

Table 1: Social Communication Behaviors\ Skills

Social Communication Skill	Description	Reference
Language Skills	**Refers to children writing, speaking, reading and listening skills in their respective native language.**	**(Kersner and Wright, 2013)**
Grammar and Spelling	**Refers to children Grammar and Spelling skills in their respective native language.**	**(Kemp et al., 2014)**
Description	**Refers to children ability to describe what they want easily and clearly.**	**(Kersner and Wright, 2013)**
Talking	**Refers to children ability to talk with their peers and friends easily**	**(Kersner and Wright, 2013)**
Loneliness	**Refers to children ability to stay in group.**	**(Li and Lam, 2013)**
Alertness	**Refers to children seems to be absent minded when we talk to them\her.**	**(Foreman et al., 2014)**
Reaction	**Refers to children reaction when someone speaks to him\her.**	**(Grimshaw et al., 2007, Korat and Shamir, 2007)**
Social	**Refers to children ability to participate in social event like Eid and birthdays.**	**(Ravichandran, 2009)**
Freedom	**Refers to children ability to speak freely in social gathering or to say 'No' easily when don't want something.**	**(Benjamin, 2014)**
Fluency	**Refers to children ability to use mix-language when talking (e.g. Arabic and English) or to use new words when talk.**	**(Bishop and Norbury, 2005)**

Scholars have varied opinions about the effects of mobile devices on children social communication skills and behaviors. According to (Hourcade et al., 2013), the social interaction among children improves when using tablet rather than while reading books especially in the storytelling activities. In addition, using mobile applications has a potential to support "children's creative writing skills in order to motivate them to complete their writing tasks" (Kanala et al., 2013). Also (Kirkorian et al., 2008) mentions that the use of mobile devices by children could improve their social skills. On the other hand, a recent study done by (Genc, 2014), surveyed parents on the use of smartphones by their preschool children. Parents with a positive opinion and attitude towards smartphones said that it was

a source of improvement for the children's motor and cognitive skills, visual memory, and their adaptation to technology. While parents with a negative opinion said that it may cause a physical or mental problem in the future as they fear that their children will be introverted, will have an isolated life, or would be affected by harmful radiation.

Some studies have reported negative effects, since the use of some features in mobile devices such as animation could cause "distraction to reading comprehension and could divert the children's attention away from learning." (Grimshaw et al., 2007, Korat and Shamir, 2007). Apparently, the reaction of children would be somehow slower when using mobile devices and their reading skills could also be affected. Some parents confided that they are uncomfortable with the use of smartphones by their children. In addition, some parents mentioned that using these types of devices could affect the improvement or grooming of the kids. Therefore, the use of mobile devices should not be preferred by the children over their physical and developmental actions or social relationships or while communicating "with peers, family members, or teachers". Additionally and when children use e-book for learning, they recall few details due to the additional distracted features provided in the e-book such as games and Wi-Fi (Chiong et al., 2012).

On the other hand, according to (Radesky et al., 2015), the interaction between parents and children during mealtime could prevent children from a number of issues, such as obesity (Hammons and Fiese, 2011), asthma (Fiese et al., 2011) and adolescent behavioral risks (Skeer and Ballard, 2013). The presence of mobile devices during this time could mitigate these benefits (Coon et al., 2001). Generally, mobile devices affect a parent-child interaction and is ought to be studied further to understand the effects of their usage upon the parent-child engagement in a lifelike context (Radesky et al., 2015).

Research Methodology

This research started with a general literature review in an aim to define the research objectives and questions. It carried out an exploratory case study on the Omani parents to assess their perspective on the effects of mobile devices on their children social communication behaviors. In parallel, a more focused literature review was carried out to develop a survey instrument. The research instrument has been designed based on the literature review and research objectives. Afterwards, the survey validity was conducted in two stages. The first stage was "Face Validation", in which the questionnaire templates were distributed among Information Systems experts or other department's experts to collect some comments about whether the questions effectively captured the topic under investigation (Are survey questions understandable or confusing). The second stage was "Pilot Survey Test", in which the survey questions were distributed to 10 parents in the college to test the data for any statistically weak questions. The questionnaires were refined based upon the outcomes of the survey validation stage in order to match all the comments which were provided previously.

The questionnaire was divided into different sections to achieve different aims. The questionnaire template has been designed in four sections to emphasize a better understanding and easy way of completion. It begins with demographic (Background Information) questions of the parents; including relationship of the participant to the children, age, education, income level, marital status and number of children corresponding to their ages. The second section is about parents' usage of mobile devices to assess if they are a mobile device user, number and types of mobile devices they own, how often they change a mobile device, and finally the amount of time they spend while using the mobile devices. The third section is the same as the second section but asks questions about the children and their usage of mobile devices. The aim of sections 2 and 3 is to assess the fluency of parents and children in using mobile devices (though this is beyond the scope of this paper). The last section is divided into two main parts: 1) social communication skills to survey parents take on the effects of mobile devices on their children social communication skills/behaviors, 2) Parents' awareness about the effects of mobile devices on their children social communication skills/behaviors.

Findings

Neural networks (non-linear statistics (Baxt and Skora, 1996)) is comparatively a new mathematical approach for recognizing the perceptive patterns in data (Coats and Fant, 1993). It is capable of understanding complex relations in a data set. Since it tries to mimic the human brain, its performance is considered superior to the traditional causal explanatory models (Chong et al., 2013). The neural network modeling has been successfully applied in predicting bank bankruptcy, loan assessment and many other domains. Here, the study aimed to use neural networks analysis to assess key variables as possible predictors of the study main variables (Parents' Happiness and Parents' Awareness). Tables 3, 4 define key variables that have been tested.

Table 3: Parents' happiness and independent variables

Dependent Variables	Independent Variables	Question No.
Parents' Happiness	**Gender of parents**	**Q2**
	Age of parents	**Q3**
	Education Level of parents	**Q4**
	Income Level of parents	**Q5**
	Number of hours spent by parents in using mobile devices	**Q13**
	Number of hours spent by children in using mobile devices	**Q19**
	My children's language skills are progressing well .	**Q21_1**
	My children's grammar and spelling skills are progressing well.	**Q21_2**
	My children are able to describe whatever they want to easily and clearly.	**Q21_3**
	My children are able to talk with their peers and friends easily.	**Q21_4**
	My children like to stay in groups.	**Q21_5**
	My children often seem to be absent- minded when we talk to them.	**Q21_6**
	My children's reaction is not slow when we start talking to them.	**Q21_7**
	My children like to participate in social events like Eid and birthdays.	**Q21_8**
	My children speak freely at social gatherings.	**Q21_9**
	My children are able to say 'No' easily when they don't want something.	**Q21_10**
	My children use multi-languages while talking. (e.g. Arabic and English)	**Q21_11**

	My children always use new words while talking.	**Q21_12**
	It is normal that my children own mobile devices.	**Q23_1**
	I feel safe when my children use mobile devices when I am not with them.	**Q23_2**
	It is normal that my children have access to social networks via mobile device.	**Q23_3**
	It is normal that my children play online games via mobile devices.	**Q23_4**

Parents' Happiness

Here we explore how parents perceive several issues that are seen to affect their happiness regarding the usage of mobile devices by their children. The dependent variable is presented in Q24 in which it is being asked about the parents' happiness for their children using the mobile devices. On the other hand, many independent variables may have an effect on parents' happiness in order to achieve the study objectives. Table 3 represents all 31 independent variables. After performing the neural networks analysis, table 4 shows each variable with its importance to the base variable. The variables are in ascending order among which the first variable has the highest importance. The test, "It is normal that my children own mobile devices," scored the highest importance. More details are in table 4. All the variables with an importance level of 44.4% and above was selected for a second test that aims to rank the top variables against each other. Results are presented in Table 5.

Table 4: The Results of Neural Networks Tests (Parents' happiness as dependent variable)

Variables	Normalized Importance	Importance
It is normal that my children own mobile devices , Q23_1	100.0%	.066
It is okay that parent do not allow their children to use mobile devices. Q23_6	96.9%	.064
My children often seem to be absent- minded when we talk to them. Q21_6	96.3%	.064
My children's reaction is not slow when we start talking to them .Q21_7	95.9%	.064
It is normal that my children play online games via mobile devices. Q23_4	91.9%	.061
My children's grammar and spelling skills are progressing well. Q21_2	91.8%	.061
I feel safe when my children share personal photos via social networks .Q23_8	77.3%	.051
My children are able to talk with their peers and friends easily. Q21_4	71.0%	.047
I feel safe when my children use mobile devices when I am not with them. Q23_2	69.8%	.046
It is okay to allow the Wi-Fi network being connected to my children's mobile device all the time. Q23_7	68.9%	.046
My children's language skills are progressing well. Q21_1	66.7%	.044
My children like to stay in groups .Q21_5	59.4%	.039
My children are able to say 'No' easily when they don't want something. Q21_10	50.3%	.033
I talk with my children about mobile devices' risks. Q23_10	49.8%	.033
Age of Parents	46.3%	.031
Parents' Awareness	44.4%	.029
My children like to participate in social events like Eid and birthdays .Q21_8	39.5%	.026
Gender of Parents	39.2%	.026
Number of hours spent by parents	38.3%	.025
My children use multi-languages while talking .(e.g. Arabic and English) Q21_11	35.8%	.024

It is normal that my children can access social networks via mobile device. Q23_3	**31.5%**	**.021**
I feel safe when my children contact strangers .Q23_9	**22.8%**	**.015**
Education Level of parents	**22.3%**	**.015**
Parent Mobile Fluency	**18.3%**	**.012**
My children speak freely at the social gatherings. Q21_9	**16.3%**	**.011**
Number of hours spent by children	**13.9%**	**.009**
It is good for a specific age of children to use and own mobile devices. Q23_5	**12.2%**	**.008**
My children are able to describe whatever they want easily and clearly. Q21_3	**12.0%**	**.008**
Income level of parents	**10.9%**	**.007**
My children always use new words while talking. Q21_12	**10.0%**	**.007**
Children Mobile Fluency	**5.0%**	**.003**

As shown in table 5, the first variable has a stronger relationship with the base variable, "I feel safe when my children use mobile devices when I am not with them," and it scored the highest level of importance rather than the others with the normalized importance of 100%. Secondly, "My children like to stay in groups", scored the second highest importance level, while the others were with the normalized importance level of 75.6%. On the other hand, "My children often seem to be absent minded when we talk to them" scored the least among others. More details are in table 5. A comprehensive diagram for the top sixteen variables is provided in Figure 10, which shows the top sixteen predictors with the highest percentages.

Table 5: Top sixteen vaiables

Independent Variables	**Normalized Importance**	**Importance**
I feel safe when my children use mobile devices when I am not with them. Q23_2	**100.0%**	**.150**
My children like to stay in groups. Q21_5	**75.6%**	**.113**
It is okay to allow the Wi-Fi network being connected to my children's mobile device all the time. Q23_7	**75.0%**	**.112**
It is normal that my children own mobile devices. Q23_1	**67.6%**	**.101**
It is okay that parents do not allow their children to use mobile devices .Q23_6	**54.8%**	**.082**
Parents' Awareness	**47.9%**	**.072**
My children's language skills are progressing well. Q21_1	**44.9%**	**.067**

I talk with my children about mobile devices' risks .Q23_10	**32.3%**	**.048**
Age of Parents	**31.6%**	**.047**
My children's grammar and spelling skills are progressing well. Q21_2	**27.0%**	**.040**
My children are able to say 'No' easily when they don't want something .Q21_10	**24.6%**	**.037**
My children are able to talk with their peers and friends easily. Q21_4	**23.0%**	**.034**
I feel safe when my children share personal photos via social networks .Q23_8	**19.6%**	**.029**
My children's reaction is not slow when we start talking to them. Q21_7	**19.2%**	**.029**
It is normal that my children play online games via mobile devices. Q23_4	**14.3%**	**.021**
My children often seem to be absent -minded when we talk to them .Q21_6	**11.0%**	**.017**

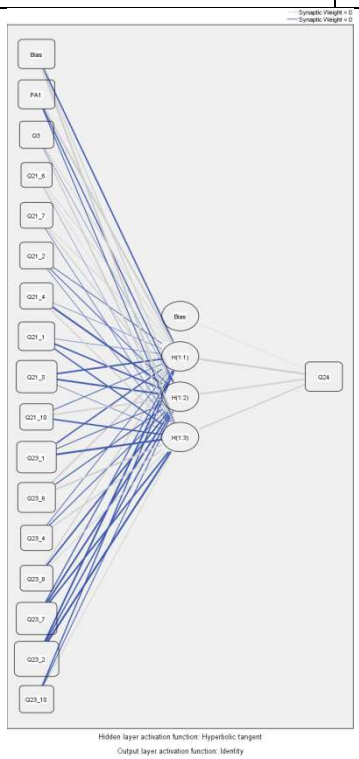

Figure 10: Relationship between (Parents' Happiness) and Independent Variables

Parents' Awareness

This section explores the variables influencing upon the awareness of the parents regarding the effects of mobile devices on children. The base variable asked about parents' awareness regarding the effects of mobile devices on their children. Table 6 presents the chosen eight dependent variables.

Table 6: Parents' Awareness and Independent Variables

Dependent Variable	Independent Variables
Parents' Awareness	**Children Mobile Fluency**
	Age of parents
	Parent Mobile Fluency
	Number of hours spent by children while using mobile devices
	Income Level
	Education Level
	Number of hours spent by parents while using mobile devices
	Gender of parents

Table 7 illustrates the results of neural network test. The variables are in ascending order. The first variables have the highest importance among others. For this test, "the number of hours spent by parents" scored the highest percentage followed by the income level and age of parents. On the other hand, parent mobile fluency was the least important among other variables. More details are in table 7. A comprehensive diagram for this test is provided in Figure 11, which shows the relationship between the base and dependent variables.

Table 7: The Results of Neural Networks Tests (Parents' Awareness as dependent variable)

Independent Variables	Normalized Importance	Importance
Number of hours spent by parents while using mobile devices (Q13)	**100.0%**	**.230**
Income Level of Parents(Q5)	**92.6%**	**.213**
Age of parents (Q3)	**78.5%**	**.181**
Number of hours spent by children while using mobile devices (Q19)	**60.0%**	**.138**
Education Level of Parents(Q4)	**38.4%**	**.088**

Gender of parents (Q2)	**26.5%**	**.061**
Children Mobile Fluency (CMF)	**20.6%**	**.047**
Parent Mobile Fluency (PMF)	**17.9%**	**.041**

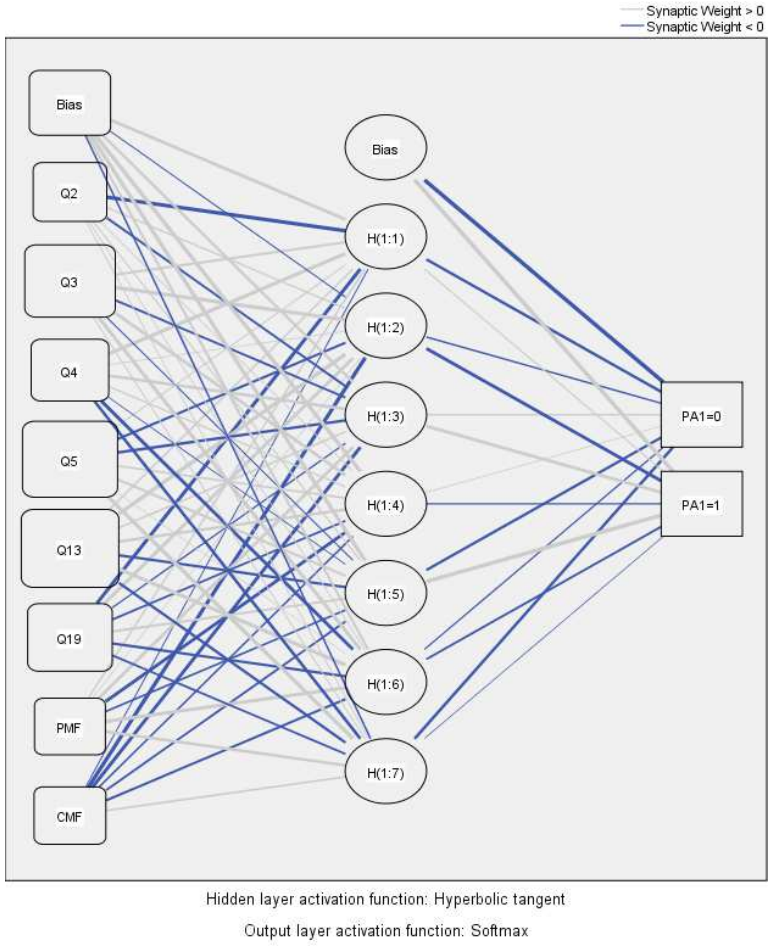

Figure 11: Relationship between (Parent Awareness) and independent variables

Discussion

The first and utmost objective of this research was to assess the happiness and awareness of parents in Oman about mobile devices' usage and impacts upon their children. Parents Happiness and Parents Awareness were analyzed previously. Figure 12 shows a comprehensive model for both variables and its predictors, and Table 8 describes each of these predictors. As observed, only one common variable affects both variables, and that is the age of parents. The change in the age of parents may have an effect on parents' happiness and awareness. In other words, the age of parents is more likely to affect their awareness and happiness on their children's' usage of mobile devices.

Table 8: Each Indicator with Description

No.	predictors	Description
1	Sense of Safety	Parent feels safe when their children use mobile devices when parent not with them
2	Loneliness	
3	Wi-Fi Approval	Parent feels safe when their children connect mobile devices to Wi-Fi Network
4	Mobile Approval	It is normal that children own mobile devices
5	Mobile Ban	It is okay that parents do not allow their children to use mobile devices
6	Language Skills	Children's language skills are progressing well
7	Talk about mobile devices risks	Parent talks with my children about mobile devices' risks
8	Grammar and spelling kills	Children's Grammar and spelling kills
9	Freedom skills	Children are able to say 'No' easily when they don't want something
10	Talking skills	Children are able to talk with their peers and friends easily
11	Sense of Safety (share personal photos)	Parent feels safe that their children share personal photos via mobile devices
12	Reaction skills	Children's reaction is not slow when we start talking to them
13	Online Games Approval	Parent feels normal that their children play online games via mobile devices
14	Alertness skills	Children often seem to be absent -minded when we talk to

		them
15	**Parents' Hours**	**Number of hours spent by parents while using mobile devices**
16	**Income Level**	**Income level of parent**
17	**Children's Hours**	**Number of hours spent by children while using mobile devices**
18	**Education Level**	**Education level of parent**
19	**Gender**	**Gender of parent**
20	**CMF**	**Children mobile fluency**
21	**PMF**	**Parent mobile fluency**
22	**Age**	**Age of parent**

Other interpretations are as follows:

- The awareness of the parents about the effects of mobile devices' usage among children influences their happiness.
- Parents who feel safe regarding their children's use of mobile devices when not with them are more likely to be happy about their children using the mobile phones.
- Parents whose children like to stay in groups are more likely to be happy regarding their children mobile devices' usage. d
- Parents who allow their children to connect to the Wi-Fi network all the time are more likely to be happy regarding their children mobile devices' usage.
- Number of hours spent by parent has an impact upon their awareness regarding the effect of mobile devices used by their children.
- Parents' income level and age has an effect upon their awareness regarding the effect of mobile devices used by their children.

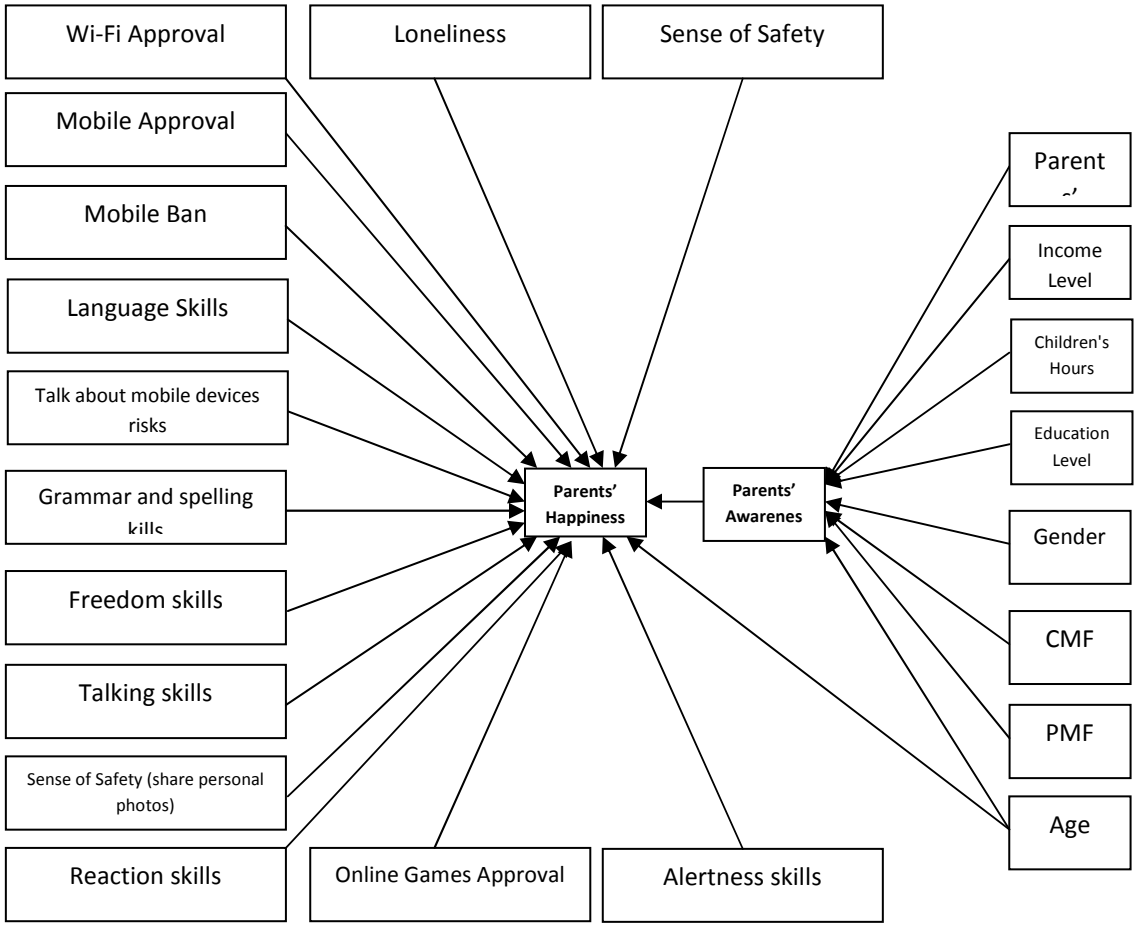

Figure 12: Parents Mobile Happiness and Awareness Model

Another related aim of the study was to identify the social communication effects of mobile devices on children in Oman. Table 8 shows the social skills that are ranked by parents.

Table 8: Ranking of social communication skills of children

No.	**Statement**	**Rank**	**Percentage**
1	**Children Social Effect 8: Social**	**1**	**80.5%**
2	**Children Social Effect 9: Freedom**	**2**	**75.1%**
3	**Children Social Effect 4: Talking**	**3**	**69.7%**
4	**Children Social Effect 3: Description**	**4**	**63.2%**
5	**Children Social Effect 1: Language Skills**	**5**	**61.7%**
6	**Children Social Effect 5: Loneliness**	**6**	**60.6%**

7	**Children Social Effect 8: Social**	**7**	**58.3%**
8	**Children Social Effect 7: Reaction**	**8**	**55.6%**
9	**Children Social Effect 2: Grammar and Spelling**	**9**	**52.5%**
10	**Children Social Effect 10: Fluency**	**10**	**46.3**
11	**Children Social Effect 10: Fluency**	**11**	**34.5%**
12	**Children Social Effect 6: Alertness**	**12**	**24.5%**

Recommendation

The last question in the questionnaire was a 'Yes' or 'No' question of which participants was asked if they are happy about their children usage of mobile devices. Interestingly, more than half (52.1%) of the parents have answered "Yes", while the rest (47.9%) answered "No". The parents may have a mixed opinion about their children's mobile use. Although the reaction of the parents to their children's social communication skills was positive in general, still 47.9% are not happy. The reason could be that parents might have felt reluctant to honestly answer the social communication section which may signal a failure in supervision. Another reason could be that parents were forced to give their children mobile devices. It could also be a mean for parents to gain peace of mind, social status, or as a social pressure from their own peers and relatives. In all cases, such discrepancies in the findings urge us to treat the results carefully. It is highly recommended for future work to apply not only the quantitative but also a qualitative method in order to assess and observe parents' perception of mobile devices' usage among their children.

Abstract

Enterprise Architecture (EA) has been identified as one of the prime initiative towards public sector transformation. EA implementation innovates public sector management. However, building upon several public sector agencies that had implemented these initiatives, it was reported as unfavourable in sustaining EA practices. This study aims to i. identify related issues and challenges towards sustainability of EA implementation and ii. to identify factors that influence sustainability of EA practices. Through qualitative approach, six related issues were discerned and six key factors were established in sustaining EA practices in the construction of EA governance framework. With regards to the practical implication, this paper can serve as reference in establishing EA initiatives in the public sector.

Keywords: Enterprise Architecture, EA Management, public sector, sustainability, issues and challenges

1. Introduction

Public sectors are increasingly aware of the importance of employing E-government to improve the delivery of public services to the people (Sebastian & Supriya 2013). This becomes the main agenda towards transformation of public sector service delivery. According to Malaysian Public Sector ICT Strategic Plan 2011-2015, ICT transformation agenda planned to support four ICT Strategic Thrust that is i. Enhancing Service Delivery ii. Connected Government iii. Good Governance and iv. Sustainable and Resilient ICT. In order to transform, this four strategic thrust that consists of business and IT driven need to be aligned. This can be achieved by embarking Enterprise Architecture (EA) practices. According to Waseda University World E-Government Ranking Government, EA is relevance with the transformational government goals to ensure efficient government management by improvement of interactions with business, citizens and within the government agencies (Obi & Iwasaki 2010).

Most developed nations have embarked on this phenomena in recent years because without EA an organisation will risk being uncompetitive, ineffective, inefficient, and lack resilience to challenges from and within the environment. Thus, EA brings innovation in managing Public Sectors (MAMPU 2015; Nikpay et al. 2015). However, organisation becoming complex over the year due to rapid development of technology and vast number and complexity of information systems in running operations (Seppanen et al., 2009). This includes public sector towards more responsive service to the citizens and businesses. To manage the interrelationships and growing demands on business agility, EA act as an innovation mechanism to overcome this complexity by aligning between business and IT (Iyamu & Mphahlele 2014; Seppanen et al. 2009; Aier & Schelp 2010). Prior to this, EA is a structured approach used to manage and define an organisation across different domains. It is often used as a practice to help transform the organisation through understanding, reconciling and planning across the Business, Data, Application and Technology domains (MAMPU 2015; Nikpay et al. 2015). According to the result of the research being conducted among CIO in the public sector,

Whole of Government (WoG) approach is through EA (MAMPU 2016). EA act as an ecosystem enabler (MAMPU 2016). This ecosystem enabler is needed to support the implementation of IT Strategic Thrust.

To date, EA is implemented in five public sector agencies in Malaysia. Malaysian Public Sector has come out with an initiative called 1 Government Enterprise Architecture or 1GovEA. 1GovEA act as a blueprint to improve consistent and comprehensive Digital Government service delivery. However, based on the maturity assessment conducted by MAMPU in 2014, to sustain EA practices faced some issues and challenges (MAMPU 2015). Thus, EA approaches receive major criticisms due to frequent changes in processes, landscape, practices and procedures of government and governance (Van Der Raadt et al. 2010; Maheshwari et al. 2011; Janssen 2012).

This paper aims to identify and categorise the issues and challenge of EA management in public sector organisations since less attention is given in this area in the existing academic publications. In this study, first, the literature was studied to find out the enterprise architecture definition criteria and followed by conducting case studies of five public sector organisations that have implemented EA. Then the experts' opinion was gathered to validate the factors that affect the sustainability of EA practices in public sector organisations.

The following sections in this paper are organized as follows; Section 2, describes the literature review, which focuses on EA and the public sector EA. Section 3 describes the research methodology used for this study. Section 4 reports the result and analysis of the findings. Finally, Section 5 concludes and provides recommendations for further research on this research area.

2. Literature Review

This section explains the reviews of current literatures which consist of two sub-sections; EA and public sector EA.

2.1 Enterprise Architecture (EA)

EA is an approach for an organisation to plan strategically to facilitate in decision making process through systematic arrangement. It also can act as a blueprint for organisations to achieve current and future business objectives by alignment of strategy with business and technology. EA is concerned with a systematic arrangement of different business processes, procedures, standards, rules and regulations, information systems and technical infrastructure of current information and expected future transformations and goals (Maheshwari et al. 2011; Janssen 2012; Van Der Raadt et al. 2010). EA function basically being defined as organizational functions as a whole that interrelate through formal (governance) and informal (collaboration) processes in the enterprise, domain, project, and operational levels (Van Der Raadt et al. 2010). Therefore, in a wider perspective, EA is a holistic approach that not only limited to IT but also align with the business.

2.2 Public Sector EA

Increasingly, EA in public sector efforts are part of Electronic Government (EGOV) programs conducted by national and other levels of governments. A major application area for the Government EA (GEA) practice, Electronic Government (EGOV) is defined as strategic use of Information and Communication Technology (ICT) by governments to enable transformation in service delivery, relationships with key stakeholders, and internal working and management in government (Ojo et al. 2011).

One reason for the increasing prominence of GEA as a management and technology practice in government is its association with the transformational government goals (Ojo et al. 2011). GEA can be viewed as a practice or an artefact. As a practice, it enables rigorous description, design and

analysis of organizational structures that span the boundaries of different organizations. As an artefact, it comprises principles, methods and models used to design and implement organizational structures, business processes, and information systems and infrastructure of an enterprise (Ojo et al. 2011). According to (Jahani et al. 2010), architectures can cover a range from general architecture for the whole government to very specific for a certain organization in one particular domain. The unique differences in the governmental environment compared to corporate enterprises have also stirred a discussion of what could and should be best practice of using EA in the public (Klischewski 2014).

3. Research Methodology

As a whole, appropriate research methodology creates platform to have a proper activity in relevance area and it guides the researchers in the right direction. This research framework focuses on issues and challenges of EA implementation. Target studies are selected by searching on reliable databases, including: science direct, springer, IEEE, and ACM. The intended papers were selected by using the related search keywords, including "Enterprise Architecture Implementation", "Enterprise Architecture Issues", "Enterprise Architecture Implementation Challenges", "sustainability" and reading the whole parts of them in order to obtain appropriate studies. This study aim is to collect current issues on EA implementation based on a defined research framework especially in current decade. According to Kumar (2011), the main focus of qualitative study is to understand, explain, explore, discover and clarify situations, feelings, perceptions, attitudes, values, beliefs and experiences of a group of people. Hence, this study is using a qualitative approach to identify related issues and challenges towards sustainability of EA implementation and categorized the issues and challenges according to factors that influence sustainability. The main questions of this study are:

i. What are the innovations in managing in public sector organisations through EA?

ii. From i., what are the common issue and challenges in practicing EA?

This study was started with literature review and it is followed by conducting case studies using focus group interviews techniques and finally gathering the experts' opinion. **Figure 1** shows the process in conducting this study.

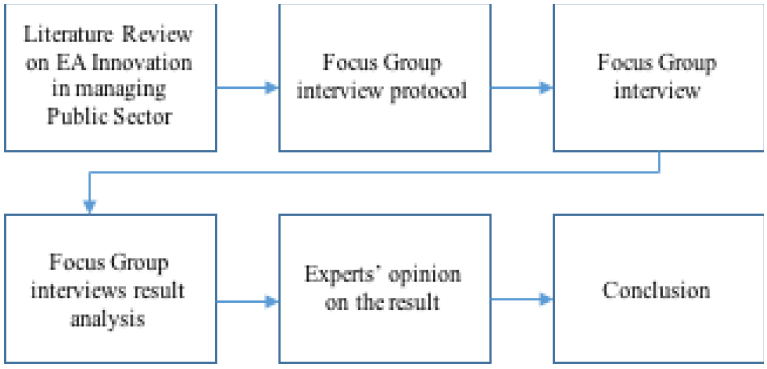

Fig. 1: The study process

The proses started by reviewing the existing literature that related to EA implementation in organisations to search for issues and challenges in sustaining the practices. From the literature, the protocol of the focus group interviews is created includes the component of heading, instructions, questionnaires, thank you statement and logs.

Next, five public sector organisations were selected as a case study for focus group interview session. The selection of public sector organisations is based on the agency that already implement EA initiatives. From each selected organisation, the EA expert and EA practitioner were identified as interviewees for the focus group interview. These interviewees were selected based on their experience and deep understanding in EA implementation in their organisation. **Table 1** indicates the selected public sector organisation characteristics and the interviewees' roles in the organisation.

Table 1: Organisations' characteristic

Organisation	**Type of organisation**	**Interviewees' role in organisation**
Organisation 1	Government agency	- Head of Administration Department - Head of IT Unit - Executive of IT
Organisation 2	Government agency	- Head of Strategic Department - Head of IT Unit - Executive of IT
Organisation 3	Ministry	- Head of Strategic Department - Head of IT Unit - Executive of IT
Organisation 4	Ministry	- Head of Strategic Department - Head of IT Unit - Executive of IT
Organisation 5	Government agency	- Head of Strategic Department - Head of IT Unit - Executive of IT

Then, the focus group interview sessions were conducted and the interviews were recorded. Subsequently, the result of the interviews was analysed by the researcher. Afterward, experts' opinions were inquired in categorizing the analysed results to come out with the conclusion. **Table 2** depicts the experts' characteristic based on their years of experience in the public sector, experience related and roles in their current organisations.

Table 2: Characteristic of Expert

Expert	**Years of experience in public sector**	**Experience related**	**Roles in current organisations**
Expert 1	35 years	- IT Managers in five Malaysia's Government agencies - Lead consultant for information management and strategies in 8 years - Team leader for more than	- Senior Lead consultant for Strategies in Malaysia's public sector

Expert	Years of experience in public sector	Experience related	Roles in current organisations
		10 information management and EA projects	
Expert 2	25 years	- IT Managers in 4 Malaysia's Government agencies - Team leader for more than 5 system development project and 4 EA project	- IT Expert (Information Management and EA in Malaysia's public sector)
Expert 3	11 years	- IT Executives in Malaysia's Government agencies - Team member for more than 4 strategic planning project and 2 EA project	- IT Expert (Information Management and EA in Malaysia's public sector)

4. Result and Analysis

This section represents collected information about EA implementation in the public sector based on the defined research method. The analysis is based on interview sessions conducted with the five public sector agencies that implemented EA.

4.1 EA implementation in Public Sector Organisations

One of the main problems an enterprise has to face today is sustainability in an dynamic environment (Schoenherr & Aier 2005). The interviews revealed that the public sector organisations have issues and challenges to sustain EA implementation in their organisations. **Table 3** depicted the analysed results of the focus group interviews in issues and challenges to sustain EA implementation their organizations.

Table 3: Analysed result of the interviews

Organisation	Issues and Challenges
Organisation 1	i. No mandate from government ii. No proper governance iii. No EA tool to maintain EA document
Organisation 2	i. Lack of EA awareness ii. Lack of readiness iii. Limited knowledge and skills on EA among the team iv. No EA tool to maintain EA document

Organisation	Issues and Challenges
Organisation 3	i. No mandate from government ii. Limited knowledge and skills on EA among the team iii. No proper governance
Organisation 4	i. Limited knowledge and skills on EA among the team ii. No proper governance iii. Lack of readiness
Organisation 5	i. No proper governance ii. Lack of EA awareness iii. Lack of readiness

From the Table 3, further categorization of issues and challenges to sustain EA implementation the public sector based on experts' opinions has been described in Section 4.2.

4.2 EA implementation and sustainability

From the analysed result of the interview, experts' opinion is gathered to identify factors that affect sustainability of EA implementation in organisation. The experts' dictated that factors such as i. governance ii. knowledge and skills iii. mandate iv. readiness v. awareness and vi. tools are the main factors towards sustainability of EA implementation in public sector agencies. Researchers that stated the factors in issues and challenges in sustaining EA implementation are listed in **Table 4**.

Table 4: Factors in Issues and Challenges

Factors	**Researchers**
Governance	(Seppanen et al. 2009; Iyamu & Mphahlele 2014; Kaisler et al. 2005; Sugumaran & Al-khaja 2014)
Knowledge and Skills	(Seppanen et al. 2009; Kaisler et al. 2005; Ahuja 2008; Bakar 2013)
Mandate	(Bente et al. 2012b; Janssen & Hjort-Madsen 2007)
Readiness	(Jahani et al. 2010)
Awareness	(Ahuja 2008)
Tools	(Becker et al. 2011; Bente et al. 2012a; Buckl et al. 2010)

From Table 4, six factors identified support sustainability of EA implementation in public sector organisations (Ahuja 2008; Aier & Schelp 2010; Bakar 2013; Simon et al. 2014).

5. Conclusions

To conclude, this paper identifies six factors that contribute towards sustainability of EA implementation in public sector agencies from interview of focus group from five Malaysian's public sector organisations that already implement EA and by gathering experts' opinion in classifying the factors from issues and challenges derived upon.

To date, most EA implementation faces major issues and challenges in sustaining the practices. Prior to this, to sustain EA practices, organisation need to consider the factors identified. This study has no claim to be complete. Further research is required to extend the findings. However, at this present stage, this paper can serve Malaysia's Public Sector and other practitioners as a reference in considering the factors before implementing EA in their organisation. From an academic perspective, this paper represents a theory for identifying issues and challenges towards sustaining EA practices in public sector organisations.

Abstract

Hardware, software, network and data are a part of the components required in IT infrastructure in an organization for their day-to-day operation. Any changes, demands, requests, customizations, etc. from customers towards certain product/services, changing direction or business objectives, to accommodate the technological invention and innovation and also to follow current trends, it can be done and fulfilled easily, efficiently and effectively if their IT infrastructure is flexible. Furthermore, to compete with other organizations, the organization itself must ensure which information systems should be in place and/or which one to be maintained. This leads the managers or decision makers to maximize their ability, capability, wisely and strategically use of information systems in assisting them to direct, evaluate, guide and suggest for better decision making. Therefore, this study attempts to identify the determinants of strategic utilization of information systems. Literally, most researcher identified determinants of any subject matters via literature review processes. The mechanism in capturing determinants during literature review processes is varies to one another among researchers. Mainly in this study, the researchers decided to use systematic review as it is one of the best ways for the researchers to dig and evaluates which of the dimensions best suit both dependent variables (DV) and independent variables (IV). In the process of systematic review, five (5) components involved, such as problem formulation; literature search; data evaluation; data analysis; and interpretation of results. Respective variable findings was drawn using schematic and it is lead the researchers to decide which dimension best to represent respective variable.

Keywords: systematic review, IT infrastructure flexibility, strategic utilization of information systems, phrase, literature

1 Introduction

The dependency of Information technology (IT) can be seen in various scopes and functions in an organization in order to support their daily business functions. The organization will always ensure that their IT infrastructure workable at any time. This is to ensure that there will be no transaction distortions and they able to achieve high return on investment (ROI), to some extend, some organization willing to spend some amount of money in order to ensure that their IT infrastructure is in tip top condition. IT infrastructure is classified into two (2), such technical (Duncan, 1995) and human IT infrastructure (Byrd & Turner, 2000 & 2001 & Chanopas, Krairit & Khang, 2006). In extend, Byrd & Turner (2000) and Duncan (1995) mention that technical IT infrastructure shall consist of the hardware and operating systems (platform technology), network technologies, data and application software. Meanwhile, human IT infrastructure is all about human and organizational skills, expertise, competencies, knowledge, commitments, values, norms and organizational structure (Byrd & Turner, 2000). However, Fink & Neumann (2009), developed a multidimensional definition of IT infrastructure which with addition of process IT infrastructure. Thus, they had identified a range of physical and managerial capabilities as the dimensions under this concept.

The demands of using IT infrastructure force it to be flexible to their user whenever required. To become flexible, IT infrastructure shall cater all three (3) concepts mention above accordingly. Yearly studies done and paper produced a report on this concept across disciplines. In the beginning studies conducted by Duncan (1995), Chung, Rainer & Lewis (2003), Fink & Neumann (2009), Byrd & Turner (2000 & 2001), Zhang & Ziegelmayer (2009), Chung et. al. (2005), Bush, Tiwana & Rai (2010), Sirkemaa (2002), Bhatt et al. (2010), Masrek & Jusoff (2009), Zainon & Salleh (2011) etc., there are four (4) dimensions, such compatibility, modularity, connectivity and IT personnel had been

discussed throughout the years. However, studies by Gholami, Kaviani & Zabihi (2003) and Chanopas, Krairit & Khang (2006) found additional of five dimensions such scalability, continuity, rapidity, facility and modernity.

An organization may use either Electronic systems (e-commerce) or Mobile commerce systems (m-commerce); Transaction Processing Systems (TPS); Management Information Systems (MIS); and Decision Support Systems (DSS) to support their business operation and to achieve their business goals and all these are examples of Information systems (IS). Limited studies conducted on strategic use in the context of IS. Masrek, Jamaludin & Hashim (2009) proposed conceptual framework for studying the effect of technological, organizational and environmental factors on strategic utilization of information systems. Meanwhile, unpublished thesis by Jamaludin (1996), was investigating factors that influence strategic utilization of information resources (SUIR). Thus, both studies introduced dimension such as product differentiation, cost leadership and growth advantage as a part of the concept of strategic use of IS.

Overall, in this systematic review, the researchers intended to find the following objectives:

1. To structuring the overview of strategic utilization of information systems.
2. To structuring the overview of IT infrastructure flexibility.

The rest of this paper is section as follows. Section 2 introduces the research methodology. Section 3 provides the systematic review findings. Section 4 ends the paper with a discussion and conclusion.

2 Methodology

At the beginning of getting the idea about the topic, researchers are doing traditional or conventional way of literature review. The process of search, collect and read those literatures in getting glasses or surface idea about the research topic is sufficient at that point of time. To streamline further as which concept, variables and dimensions to choose, systematic review found to be suitable in this study.

To create maximization and optimization in new and existing literature collections, we adopt the work from (Cooper & Hedges, 2009) and it is widely used i.e. (Kobus & Westner, 2015). Table 1 shows the stages of systematic review.

Table 1: Stages of Systematic Review

Stages	Details
Problem formulation	Research items are retrieved, examined, and archived using pre-defined keyword search in electronic databases
Literature search	Non-relevant research items are excluded from further analysis (as the database-driven search approach might return non-relevant results)
Data Evaluation	Remaining research items are categorized
Data Analysis	Emerging themes of research are determined
Interpretation of Results	The validity of research is described

2.1 Literature Retrieval

In the process of searching and retrieved, this study focused on peer-reviewed journals and conferences on selected online databases that have been decided earlier. List of searches focus by online databases is shown in Table 2.

Table 2: Searching Focus by Online Databases

Search Focus	Searched Online Databases
Journals	ACM Digital Library, ProQuest, Emerald Insight, ScienceDirect, Scopus, Web Of Science, Wiley Online Library, Google, Google Scholar
Conferences	IEEE Xplore, Google, Google Scholar

Upon deciding which online databases to use, the researchers set several phrases to use during the searching process. The phrase is based on the theme that reflect the concept of this study. For the journals and conference papers or proceeding papers, the searching was derived not using any solid keywords, combination of keyword and string such AND, OR, "", '-', '+' etc. In this case, the researchers more prefer to use phrases that reflect the topic of the study. For the first (1st) and second (2nd) iteration, the researchers use phrases that related to the independent variable (IV) while phase that related to the dependent variable (DV) was during the third (3rd) iteration. Thus, the searching was done three (3) iterations with different phase. Below is the list of phrases that researchers used in this study:

Table 3: The List of Phase Used during the Searching

Iterations	Phase
1st	IT Infrastructure
	Technology Infrastructure
	System Infrastructure
	Physical Infrastructure
	IS Infrastructure
2nd	Information Technology Infrastructure Flexibility
	IT Infrastructure Flexibility
	Information Systems Infrastructure Flexibility
	IS Infrastructure Flexibility
	Information Technology Architecture Flexibility
	IT Architecture Flexibility
	Information Systems Architecture Flexibility
	IS Architecture Flexibility
3rd	Strategic Use of Information System
	Strategic Use of Information Technology
	Competitive Advantage of Information System
	Competitive Advantage of Information Technology
	Strategic Utilization of Information System
	Strategic Utilization of Information Technology

2.2 Literature Exclusion

In this systematic review searching or query, the researchers do not eliminate the use of abbreviation of certain words such "IT" for Information Technology and "IS" for Information System and this is also had been done by (Kobus & Westner, 2015).All words and abbreviations are used to give a higher probability of getting any closer journal or conference papers or proceeding papers that most matched the searching.

No matter which online databases are used, the same search strategy was applied across these three (3) iterations. Whenever there were no results, another or broader phrase search was used as shown in Table 3. The extensive use of broader keyword is necessary during the searching. After all, any journal or conference papers or proceeding papers were excluded when the researchers found not relevant for the study. According to (Kobus & Westner, 2015), all these journal or conference papers or proceeding papers can be considered not relevant whenever at least one of the following criteria was applied:

Table 4: Criteria in Filtering the Searching

Criteria	Explanations
1	Its main focus is not on strategic in the context of the Utilization of IS and flexibility in organization's IT Infrastructure
2	Its main focus is not on the Utilization of IS with sub-focus on strategic and flexibility in organization's IT Infrastructure
3	Its length is 2 pages or less
4	It does not apply any of Strategic Utilization of Information Systems or IT Infrastructure Flexibility point of view
5	It has no original content (e.g. syllabus of study in any program offer, proposals describing only planned research, foreword in any conferences or seminars) or resulted in a journal

2.3 Literature Categorization

After applying the above criteria as in Table 4, leaving 472 journals or conference papers or proceeding papers to proceed with the literature categorization. All relevant and matched journal or conference papers or proceeding papers were kept and managed accordingly. Each group of phase that had been set earlier was used at each online database. Upon filtering and exclusion, each literature was managed and labelled respectively by dedicated folder as illustrated in the figure 2 below:

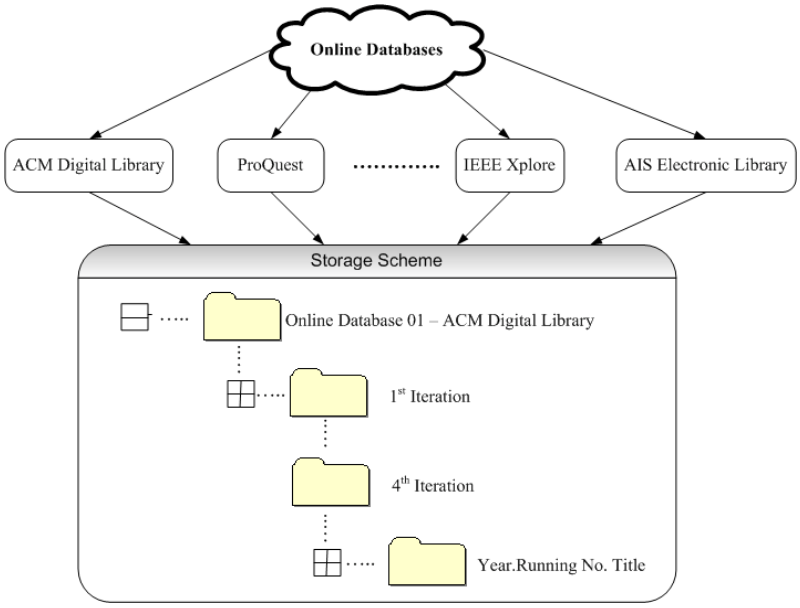

Figure 1: Literature Management

The next phase is extracting the key point at each literature. The main purposes are to identify the dimensions of strategic utilization of information systems and the dimensions of IT infrastructure flexibility. In order to capture and identify those dimensions, the researchers follow (Dibbern, Goles, Hirschheim and Jayatilaka, 2004) as also adopted by (Kobus & Westner, 2015)and little enhancement has been made. Originally, the categorization of items is reference theory; research approach; research type; data gathering and data analysis. Field of the literature and country has been add-up with this note taking.

3 Results

3.1 descriptive analysis: selection of relevant literature

The search resulted in a total of 472 journals or conference papers or proceeding papers were extracted for three consecutive months and the breakdown by iteration is shown in Table 5. All this literature is initially in scope for literature review. On top of that, all these literatures was being examined, archived and analyzed their relevancy in order to identify the dimensions of strategic utilization of information systems and the dimensions of IT infrastructure flexibility.

Table 5: The Breakdown by Iteration

Searching Area	Online Database									
	ACM Digital Library	**ProQuest**	**Emerald Insight**	**IEEE Xplore**	**ScienceDirect**	**Scopus**	**Web Of Science**	**Wiley Online Library**	**Google**	**Google Scholar**
1st Iteration	6	6	12	4	7	2	0	2	14	13
2nd Iteration	13	35	17	21	36	4	6	6	27	43
3rd Iteration	17	5	63	25	55	3	3	*	16	11

* Pdf file cannot open

3.2 the dimensions of variables

Using the literature categorization by (Dibbern, Goles, Hirschheim and Jayatilaka, 2004), researchers able to identify every dimension respectively. As mention above, the first (1st) and second (2nd) iteration were searching the independent variable (IV) while the dependent variable (DV) was during the third (3rd) iteration. At first, researchers used the generic template or form to fill-up information according to the literature categorization. Based on this form, researcher transforms into a table and diagram (was inspired and shared by one of the friends in the Facebook Doctorate Support Group) which appropriate to get a clearer picture on the selection of the dimensions. The summary of the DV is shown in Figure 4 and the IV is shown in Table 6 respectively. The results show only some part or most prominent authors and not from all literatures. With the use of systematic review exercise, it helps researchers a lot in framing and confirming which dimensions to use for the study.

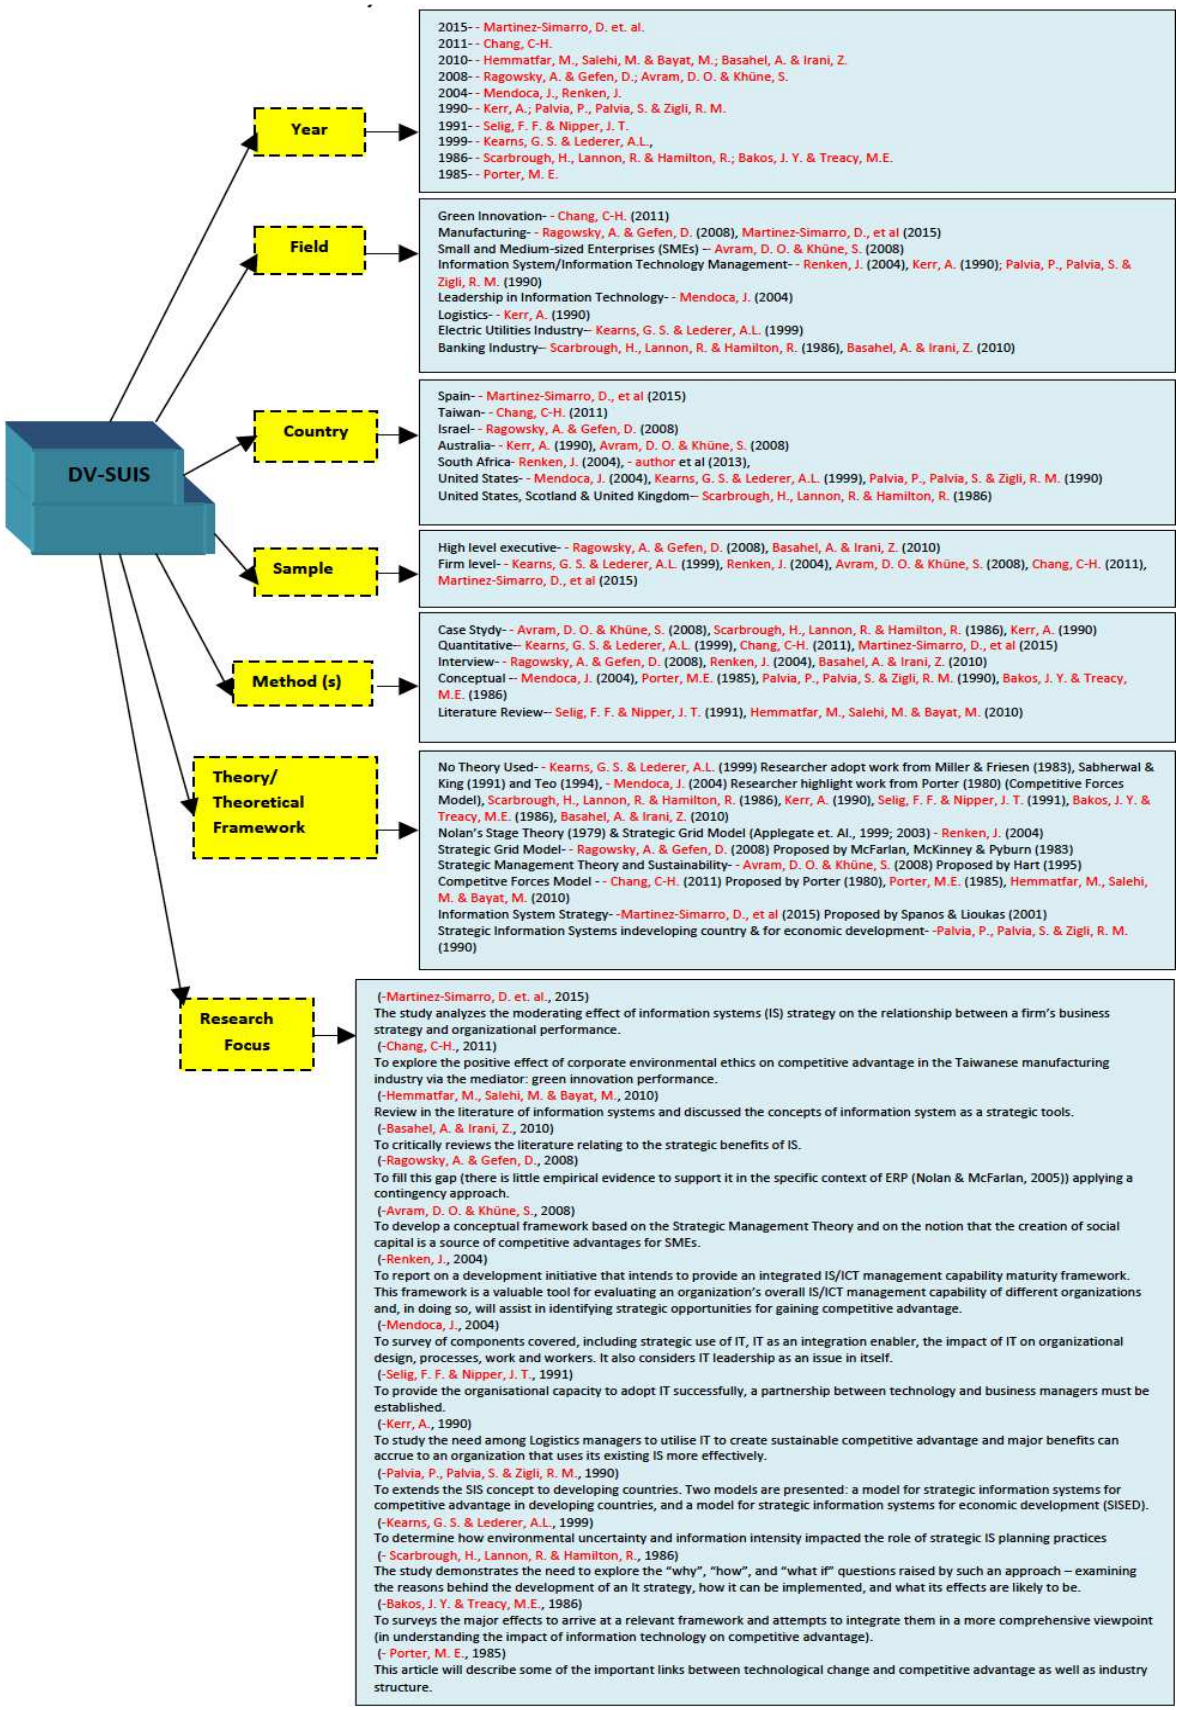

Figure 2: The Summary of Dimension for the Dependent Variable (DV)

Table 6: The Summary of Dimension for the Independent Variable (IV)

Author(s)	Human IT Infrastructure				Technical IT Infrastructure				Process IT Infrastructure	
	Business Knowledge/Skills	Management Knowledge/Skills	Technical Knowledge/Skills	Technology Knowledge/Skills	IT Modularity	IT Compatibility	IT Connectivity	IT Continuity	Range of Managerial Capabilities	Range of Physical Capabilities

4 Discussion & Conclusion

The selection of the dimensions for the DV and IV was basically derived from the results of the systematic review conducted. By doing the systematic review, researchers get clearer picture on the evolution of each variable; which field has adapted and adopted the concept; what type of methodology that other researchers did etc. To understand the whole concepts of the study, researchers needs 360 degree view about it. The motivation of the study was captured too thru this systematic review.

The hassle in doing systematic review is where the researchers required to captured every single process involved. More over, the researchers also shall be able to identified important components or section in articles they read and note it down. This is due to some articles discussed the dimension in narrative methods while others prefer in schematic way. Currency and relevancy are a part of criteria to look into while choosing those dimensions for the DV and IV at the end. Perhaps, this approach also shall be able to search and identify the reasons behind all “how” and “why” in the study.

The approach or method used here is best suit for any who will like to undergo quantitative study. It is important to identify first the IV and DV involved between concept where no matter what researchers will like to find out in their study which either to measure the difference, correlation or factors that influence between concept.

Based on the systematic review conducted, the choice of these dependent variables to form the framework is taken from the previous works by (Masrek, Jamaludin & Hashim, 2009; Jamaludin, 1996), which are product/service differentiation; cost leadership and growth advantage. While for

independent variable in this study will measure the dimensions of IT infrastructure flexibility, such Human, Technical and Process IT infrastructure (Masrek, Jamaludin & Hashim, 2009; Jamaludin, 1996; Hilhorst, Ribbers, Heck & Smits, 2008; Duncan, 1995; Chung, Rainer & Lewis, 2003; Fink & Neumann, 2009; Byrd & Turner, 2000; Byrd & Turner, 2001; Zhang, Li & Ziegelmayer, 2009; Chung et al., 2005; Bush, Tiwana & Rai, 2010; Sirkemaa, 2002; Bhatt et al., 2010; Masrek & Jusoff, 2009; Zainon & Salleh, 2011; Gholami, Kaviani & Zabihi, 2009; Chanopas, Krairit & Khang, 2006) etc.

Impact Assessment and Consumer Behavior: Russian Evidence

Marina Ryzhkova, National Research Tomsk Polytechnic University, Tomsk, Russia, marybox@inbox.ru

Abstract

In the article impact assessment as an instrument of economic policy has been analyzed in terms of the basic institutional concepts and notions of theory of routine behavior. Neither European nor Russian assessment practice is not complied with these principles. In detail results of two laws concerning consumer behavior were examined: consumer protection in case of content services and anti-smoking law. The first regulation problem was resolved not by the intervention of the legislator but by cellular carriers. The second law actually turned to be low-performing. We suggest the need to implement behavioral principles in the impact assessment of drafts to improve the procedure performance.

Keywords: consumer behavior, anti-smoking law, impact assessment

Introduction

In recent years, the approach to economic policy has been changing. The successes of the behavioral sciences, increased demand on the economic policy performance and the accelerating pace of social change have led to the fact that the economic policy as a set of norms, institutions, and texts begin to shift from the declarative approach and focus on a set of procedures.

To understand the general regularities and general relationships there is a need to focus on the procedures of human behavior, in which the government tries to interfere for the purpose of regulation of economic activity.

Samples of behavior (in the scientific literature - memes (Wilkins (1998), Olney (1998), Brodie (2009)) as a strategy of behavior are developed not by themselves, but in the context of the existing socio-economic system. Features of memes are determined on the basis of typical for this community configuration of social institutions Those memes, which are the behavioral implementation of affirmations (routines), correspond to social conditions and are constitutive for them, become meta-routines. Groups of consumption memes which are well adapted to the conditions prevailing in the society due to their effectiveness are easy to expand and form the core of behavioral strategies, which are typical for the variant of social structure. On the one hand, the economic system and the system of relationships in it define existing meta-routines. On the other hand, a set of typical patterns of behavior, their everyday adhering and implementation in the behavior of the overwhelming mass of citizens is the essence of the socio-economic system.

Routine as a Basis of Consumer Behavior

In institutional economics the following understanding of four interrelated concepts (the routine, rules, norms and institutions) has developed.

1. Routine as the way of compact storage of knowledge and skills required for everyday human activities, mostly unconscious response patterns of behavior.

2. Norms as regulations on possible ways of behavior in the most general terms.

3. Rules as a sequence of actions in the particular choice situations aiming the elimination of the uncertainty of the reaction from other people or nature.

4. Institutions (according to D. North (1990)) as rules of the interaction in society, supplemented by enforcement mechanisms.

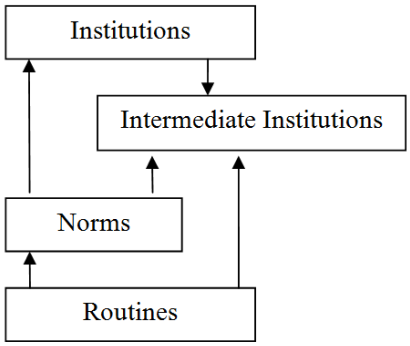

Fig. 1. Interconnections between routines, norms and institutions

From this set of definitions the logic of the evolution of relations in the socio-economic system does not follow. Revealing the logic of the genesis and evolution of the principles of our behavior, we are intended to make clear some other points of difference between the concepts. The logical connection of institutions, norms and routines is displayed in Fig. 1.

The starting point for the building of a system of relations "institution - norm - routine" is, of course, the routine. As conditions change and the subject hits in an unfamiliar situation, she produces a behavioral strategy which played over and over again in case of initial success and of repetitions of situations. This behavior is observed by other individuals, is reproduced by themselves and is expected from the rest of others. Thus, the new, but already routinized, behavior becomes a norm. Existing and occurring institutions are adjusted to this norm. We do not exclude the reverse process. By changing formal institutions (regulatory framework and supporting agencies (Dukart, Ryzhkova (2013)) the norm can be changed, followed by a possible modification of the routine. More likely a revolutionary change in the institutions will not lead to the formation of new “more progressive” standards and routines, but to the emergence of duality in its performance. In parallel with formal institution a new informal intermediate institution will appear which will be designed to reconcile the existing norm and routine to the changed formal conditions. Therefore it is necessary to change formal institutions very slowly, trying to avoid conflicts with the basic patterns of behavior, which are common for the society.

Impact Assessment and Anti-Smoking Law

The inevitable consequence of the approach to behavior as a set of memes and routines is the idea of possibility of goal-oriented behavior shaping under government control. In this regard, there is a bunch of recently published papers on the normative approach to legal regulation in the framework of libertarian paternalism. It is the so-called “nudge” approach which can be described as “the development of public policy in such a way as to push individuals to the best choice without restricting their freedom.” (Hausman (2010), Thaler and Sunstein (2008), Kapelyushnikov (2013)). Recently lawmakers go from a naive belief in the literal fulfillment of new laws to their comprehension as the system prior to the approval in attempt to consider the functioning of the future rules and mechanisms for changing the current behavior (existing meta-routine). In particular, the mentioned processes start to be implemented in such a novel direction as the Impact Assessment (IA). In Europe this practice has existed since the late of

XX century so that there is considerable experience accumulated in regulating expertise. For Russia it is a new practice.

After the analysis of the European Commission webpage and the webpage of the Department of Regulatory Impact Assessment of the Ministry of Economic Development of the Russian Federation a number of relevant conclusions can be made. Firstly, these regulatory bodies are more often focused on organizational routines, which are analyzed using conventional methods of foresight. The need for "nudge" arises only for legislative acts aiming the change of individual behavior. Secondly, the behavioral approach can be found in the documents of the regulatory body extremely rare if not to say as exception. Third, recently IA has become a platform for business support in their opposition to the Russian authorities (see Official Publication of Ministry of Economic Development of the Russian Federation "Business performance as a reflection …" and "IA has become a barrier for a number of pernicious laws for business").

In particular, there are some European Commission documents containing "nudge". First of all it is Health-Enhancing Physical Activity policy (HEPA), which unfortunately pay not so much attention to the change of daily routines (only in sections "Schemes promoting active movement to school and work", "Promoting cycling and walking", "Improvement of infrastructure of active recreation", "Scheme promoting physical activity in the workplace").

In Russia in 2010 there was introduced a procedure for regulatory impact assessment (see "On general principles of organization of legislative (representative) and executive bodies"), and was established a Department of Regulatory Impact Assessment in the Ministry of Economic Development. Analysis of assessment rules (see "Rules of regulatory impact assessment") suggests that procedure spell out by the law is a behavioral treatment, but conclusions of Department of Regulatory Impact Assessment in Ministry published on its website provide a structure simplified to consultations. In particular, main disadvantages are shallow analysis, the lack of systematicity in bringing stakeholders to negotiations (the neglect of the interests of all stakeholders), and disregard for the calculation procedures.

Since the establishment of the Commission, laws concerning consumer behavior were evaluated in the following areas (on each see the reference section to the commission conclusion below):

1. Gambling;

2. Drug returns;

3. Exchange and return of consumer goods;

4. Disposal of goods;

5. Transportation accessibility to disabled;

and a number of others.

Below we provide the story of two bills in the field of consumer behavior that were evaluated and got commission conclusion, and for which is already possible to estimate the approximate social effect.

The first concerns the solution to the problem of content services by mobile operators (Federal Law 23.07.2013 No 229-FZ). Prior to the passage of the law the common practice in Russia was to provide unnecessary content services from mobile operators, payment of bills of which was carried out automatically and inobservably for the consumer. In accordance with the change in the law there were

introduced the norm of the possibility of establishing a special account from which the payment for continent services would be made. That makes the routine of the content order more difficult, and thus prevents consumer from accidental and inadvertent operations. The comments made in the conclusion of the IA concerning the unique interpretation of user confirmation actions for receiving content services, was eliminated in the final version of document, leaving the operators the opportunity to come up with a new scheme by which the consumer can still receive unnecessary services. Using the tools of the theory of consumer behavior routine, it is possible to suggest a clearly defined procedure of content services order for all mobile providers with access to a common database of content providers. But after a consideration of the problem in depth, it becomes obvious that with the help of smartphones and network exchange resources such as Play Market (Android) and the App Store (iOS), sale of content via the mobile operator makes no sense any more. As a result, by 2016 the main channels of "involuntary" sales of content services have been blocked. In addition, operators have introduced a free service "prohibition of content services."

The second concerns the another Russian law "On the protection of the health of citizens from tobacco smoke and the consequences of tobacco consumption" (hereinafter - the Law). The Law is intended to fight a bad habit, and thus applied methods should be behavioral. Indeed, the main emphasis is on gradual decline of the number of legal smoking areas, which should lead to inconvenience for smokers and, presumably, breaking bad habit. Additionally advertising and display of cigarettes at shops are prohibited, accompanied by rationing the number of cigarette packs in stores. Violation of the rules prescribed in the Law involves penalties, both for persons and corporate entities. Reading the Law, other regulations, and discussion in the media gives the impression that, in spite of the 17-month preparation process, the draft was not ready to be signed into law.

In particular, the IA conclusion indicates that there are no provisions leading to unreasonable costs of business entities, while the equipment which satisfies the Law requirements concerning the room for smoking costs between 100000 and 400000 rubles (1500 to 6000 USD), and the price of the "No-smoking" sign is 170 rubles (2,5 USD), and it must be located at the entrance to each nonsmoking room. Thus the total cost of implementation of the Law for the owners of buildings is huge.

Since the adoption of the Law additional restrictions were issued for example a decree to reduce the level of toxic substances in tobacco. Also it is necessary to have marking in black on a cigarette pack, saying about the harmful effects of cigarettes to health. The second side of the pack should contain other special inscriptions: photos of diseased human organs and warning labels. Also the production and sale of cigarettes with other types of products are prohibited, and it is decided to move tobacco kiosks from the shops and public places over a distance of three meters. It is hoped, that the use of these methods will help to combat smoking for at least one per cent of smokers.

The adopted anti-smoking law contains "nudge" in an unrevealed form: at the moment 40 % of Russians are smokers, but they were not invited to any procedure of IA thus had not been able to define and defend their interests.

And the most important thing. Prior to the introduction of the Law, smoking in a public place was accompanied by social condemnation. Condemnation was legalized, but procedurally, nothing has changed. It is possible to hold liable smokers to a fine only if an executive authority representative, a police officer or a local police inspector caught her at the time of the offense. CCTV footage as the evidence obtained in violation of the law, cannot be used in court. Therefore, to punish the lawbreaker is very difficult (Ermakova (2013). According to the Russian survey data at the time of the introduction of the Law, 67 % of respondents expressed doubts about its usefulness.

Preliminary Results of Anti-Smoking Regulation

Publications on the Internet are full of impressive quitting percentage after the introduction of the Law. But we turn to the data of big Russian sociological surveys. The effectiveness of anti-smoking campaign was measured a year after the introduction of the Law by the Public Opinion Foundation poll. From April 22, 2012 to October 5, 2014 the number of ex-smokers increased by 2%, which is in a range of statistical error. But there was an increase in the number of people who believe that the harm of smoking is exaggerated. Compared to 2008 the number of non-heavy smoker decreased (by 23%), while heavy smokers (more than 20 cigarettes a day) did not change their behavior. The vast majority of smokers (2/3) take into account the interests of non-smokers, more often in the variant that they try not to smoke or move aside in the presence of non-smokers (10%). Only 6% of smokers comply with the Law (do not smoke in prohibited for smoking places and smoking in specially equipped areas). It is difficult to determine whether they do so under the influence of the Law, or on its own convictions.

In general smokers reveal positive attitude to the anti-smoking restrictions. 50% of smokers agree with the necessity of innovation. In this sense, we cannot say that the Law causes a significant resonance in society. Of the 33% of smoking respondents, only 37% are against the Law. Thus, the Law infringes on the interests of only 12% of Russians.

The most painful measures for smokers were rising prices for tobacco products, bans on smoking in long-distance passenger trains, the ban on smoking in cafes, restaurants, bars and canteens, ban on the sale of cigarettes in shops less than 50 square meters. It all is despite the fact that 26% of respondents believe all the measures are necessary and correct. Yet the vast majority of smokers (55%) and approximately the same share of non-smokers (45%) believe that fundamentally nothing has changed after the introduction of the Law. And 69% of smokers do not feel that after the Law something has changed in their lives, and the remaining 31% felt only a change in the cost of cigarettes.

In the near future in Russia it is planned to monitor the ingredients of tobacco, to raise gradually the tobacco excise. Advertising of tobacco products will be prohibited completely.

At the same time, respondents of the nationwide survey suggest the following, in their opinion, effective measures:

1. Educational work with children and youth, organizing their leisure activities (5%);

2. A complete ban on the production and sale of tobacco products (4%);

3. Provision of affordable treatment for tobacco addicted people (1%);

4. Sale of harmless cigarettes, and search for an alternative to tobacco smoking (1%);

5. Provision of monetary and nonmonetary incentives for nonsmokers (less than 1%).

Most of these measures are mentioned indirectly in the Law, but up to now it is only intentions.

In parallel, there is an adjustment of all market agents to the anti-smoking law. Manufacturers introduced a number of innovations aimed at reducing harmful effects of cigarettes to consumers (new filters, flavors simulating the smell of natural tobacco leaf, reconstituted tobacco leaf, etc.). Producers of substitutes for cigarettes were intensified. Among them are producers of special drugs, antidepressants, gum and

patches, anti-tobacco bracelets, special medical treatments (acupuncture, massage, psychotherapy). We should also mention the appearance of electronic cigarettes and nontobacco evaporators.

Conclusion

There was a unique situation with anti-smoking law. In general, society supports the Law. Even directly affected smokers agree that it is a good idea to force people to give up smoking. Nevertheless, the dynamics of smokers and changes in their behavior suggest the lack of a significant effect of the Law.

In this case the theory of consumer behavior routine may offer to substitute one routine by another, and it is necessary to examine what needs (including psychological and behavioral) are satisfied by smoking pattern. It is necessary to develop a set of habits and measures for their implementation that will replace smoking. I suggest that economic incentives (penalties) are not the only tools that should be taken into account. Physiological (as well as sedative and antidiarrhetic), psychological and social effects matter and also should be involved in the routine maintaining process. And it is unfortunate that these aspects were not taken into account at the stage of the impact assessment.

In any case, the use of behavioral techniques and "nudge" in the world and domestic practice of policy-making is fragmental. According to the analysis of regulations and IA it can be concluded that government is not able to reconcile the views of different stakeholders, and therefore cannot avoid infringement of the interests of particular groups. Until there is no effective mechanism for such coordination, it is not much use in "nudge" as in an element of government policy.

New Media's Influence on Societies: The Conflict Between Government And Public in Turkey

Banu Baybars Hawks, Kadir Has University, Istanbul, Turkey, banubhawks@khas.edu.tr

Abstract

The media in Turkey has long been under the surveillance of government economically and politically. Turkish mass media since its foundation in the late 19th century has aimed to gain its role as the fourth estate in the Turkish political scene. During the period between 1980 and 2000, Turkish media grew more and more liberal and was able to express discontent publicly exercising its checks and balances function. After 2000, under the governance of Justice and Development Party (AKP), the media began to be the subject of widespread pressures. Digital media, as a developing platform in Turkey for expressing rights and freedoms, got its share by the government's restrictions, as well. Since the uncontrollability of the new media posed another threat for the stability of governments, attempts on restricting it became a regular practice in many parts of the world. This study claims that the restrictions imposed on new media violate both freedom of expression and free speech, and this leads to a weakening of democracy. The banning of social networking sites such as YouTube, Google Sites, and others raises questions about the functionality of democracy, since these platforms provide a venue that is widely used around the world to express alternative and dissenting views. Blocking access to websites also represents a serious infringement on freedom of speech and does not befit a democratic society.

Keywords: New media, censorship, government, public,Turkey.

Introduction

Censorship is a way for government to "protect" society from what the government thinks is inappropriate. Wherever media is present, censorship will be involved. Censorship is no longer limited to traditional media such as print media and TV. With the invention of Internet, the impact of censorship is felt much more strongly with regard to new media related resources of information and communication. The main argument of the governments in regulating the new media is to prevent negative effect of certain speech or expression on the Net, such as the ones threatening national security or consisting obscenity, child pornography, libel, etc. On the other hand, the counter arguments states that freedom of speech and expressions are the fundamental rights of all citizens, and therefore, people have the right to be free from governmental control that inhibits thoughts, ideas, and free expression.

During the 1990's when the expansion of the Internet started, countries were already passing legislation on Internet censorship. According to Cohen (1997, p.12), at around that time, more than 30 countries had enacted Internet specific censorship legislation. The main motivations of governments in regulating Internet include the desire to protect children, public morals, public safety, political objectives, and to silence racists and hate speech. Despite variations in policy, types of governance and divergent approaches in adherence to international human rights treaties, restrictions on Internet access and content seemed to be increasing worldwide at the end of 1990s (Cohen, 1997); it is now even more so. "One might think that the government does not understand the differences between other media, such as television, and the Internet. The Internet is an interactive experience in which the user selects what he or she will view. Also, the technology of the Internet does not allow people who post information to control who receive it. Overall, the Internet is an extremely different form of media, but that fact should not subject it different censorship laws" (Bitso, Fourie and Bothma, 2012).

The Internet is a social, cultural, commercial, educational, and entertainment global communications system whose legitimate purpose is to benefit and empower online users, also lowering the barriers for the creation and the distribution of content throughout the world. It is also the largest global

communication network with invisible boundaries (Akdeniz & Altiparmak, 2008). Within this context, nobody owns and governs the Internet (Cohen, 1997). It is universally accepted that information and communication technologies can significantly increase the exercise of human rights and fundamental freedoms, while they may also negatively affect these rights, freedoms and values, such as the disrespect for private life and secrecy of correspondence, and the dignity of human beings (Akdeniz & Altiparmak, 2008).

Turkey ranks among the top five countries with the highest social media usage. According to 2016 statistics, the number of Internet users has increased to 46 million in the country, showing a penetration of 58%, which was 45% in 2011 and only 13.9% in 2005. The current figure marks a sharp increase, compared to past. According to the results of ICT Usage Survey in Households and Individuals carried out in April 2015, 69.5 % of households have access to the Internet at home. By looking out this picture, it can be claimed that with high internet, mobile and social platform penetration, "social media satisfies Turkey's hyper-connected largely young population, yet at various times their usage antagonises ruling elites. This has resulted in (often temporary) efforts to close these platforms, even though they are not just used as news sources, but also forums to discuss and follow sport, entertainment and other normal everyday pastimes" (Doğramacı & Radcliffe, 2015). This study accepts the media freedom to report on news without restriction or censorship as one of the defining qualities of a liberal democratic system and proposes to examine the restrictions on the digital media as a new form of censorship; this hence is the violation of media freedom in Turkey. The article will also discuss Turkish public's reactions to censorship, with recommendations of alternative tools that can be used in place of government bans on new media.

Literature Review

Most of those who favor governments' restrictions on new media claim that "information over the Internet is controlled because open communication technology carries a certain amount of potentially harmful or illegal content. The fear is that it can be used as a vehicle for criminal activities and terrorism" (Cohen 1997). On the other hand, those opposing the restrictions believe that the main reason for the co-option of Internet infrastructure to effect filtering is political. "Whether the filtering of content in China and Iran or the wholesale blocking of traffic in Myanmar (also known as Burma) or in Egypt, filtering as a form of censorship seeks to influence the spread of ideas and to limit communication within the global community" (Bailey & Labovitz, 2011).

Since the growth of the Internet has created opportunities for cyber hackers and criminals, some arguments support the censorship of new media to fight cyber-crimes (Bihani & Hamilton, 2009). Within this context, cybersecurity gains more importance for governments as well as private companies and individuals. There are different reasons shown by governments all around the world to censor the new media. Although the intensity and types of Internet censorship may differ from one country to another, there are some concerns common to many countries. According to Cohen (1997), these ones are; "national security (weapons' making, illegal drugs and protection from terrorism), protection of minors (abuse, forms of marketing, violence and pornography), protection of human dignity (incitement to racial hatred or discrimination), economic security (fraud, pirating of credit cards), information security (malicious hacking), protection of privacy (unauthorized communication of personalized data, electronic harassment, spamming), protection of reputation (defamation, unlawful comparative advertising), intellectual property (the unauthorized distribution of copyrighted works such as music, software, books, etc.)."

New media regulation is put into practice in a different way by different countries. While China and Iran can be classified as having worst Internet censors with strict monitoring of an email and other forms of Internet communication which make impossible to send anonymous email messages. In China, filtering software is also used, and a wide spectrum of information resources are subject to censorship, such as websites, blogs, chat sessions, Internet telephony calls (Dorman 2005; Bambauer 2009; Warf 2011).

There are harsh methods used for censorship including Internet blackouts and Denial of Service attacks, prison sentences and intimidation of journalists, bloggers and Internet content creators (Warf 2011).

In Iran, transmissions of text messages on mobile phones are blocked on different occasions to disrupt protests. Iranian government also disrupts social networking sites such as Facebook in order to prevent the ability of Iranians to share information and to organize protests. Moreover, Internet communications are under the surveillance of the government, and that surveillance may have contributed to the arrests of dissidents (Calingaert, 2010). New media measures in Australia, on the other hand, because of country's strict regulations against pornography, can be compared with politically focused censorship in China. Many types of content other than pornography are affected by censorship such as gaming websites. There are different legislation supporting censorship and especially protection on pornography and child pornography in Australia. Similar to Australia, the focus of restrictions on new media is on pornography and specifically child pornography, as well as the protection of rights, namely intellectual property and copyright, in Finland. In Singapore, the rationale for censorship is based on moral grounds and especially protection against pornography. There are different guidelines used to decide on websites to be blocked; these are influenced by where websites originated from (e.g. from home versus an institution) and who is accessing the information (i.e. younger or older people). Universities have been reported to maintain different Internet servers for staff and students. Although classified as a democratic country, United Kingdom exerts strict control on Internet because of the concern of national security. Although a democratic country, the United Kingdom seems to have very strict rules on Internet censorship and especially Internet surveillance, owing to a strong concern for national security. Deep-packet inspection technology is used in the country and surveillance includes the use of mobiles and YouTube. The legislation governing the issues related to Internet censorship has been accepted, and the government is in the phase of forming further legislation to regulate more specific issues including national security, data protection and privacy (Bitso, Fourie and Bothma, 2012).

As underlined, regulation of the new media is mostly done with motivations of protecting national security or protection of children from unwanted material surfaced on the Net. Internet is a different type of medium because of its characteristics. If we assume that all citizens of the world shall have a right to access information, then blocking mechanisms and other ways used by governments to control new media may have negative consequences on their knowledge, their ability for decision-making, educational opportunities and insights in e.g. other religions and ideologies.

Media Freedom and Public Opinion

In democratic societies, governments need to take public's views, expectations, and recommendations into consideration in order to be effective and successful governments. *WorldPublicOpinion.org* conducted a survey in October 2008 with 20,512 respondents around the world including 22 nations; China, India, the United States, Indonesia, Nigeria, Russia, Argentina, Azerbaijan, Britain, Egypt, France, Iran, Jordan, Kenya, Mexico, Peru, Poland, South Korea, Thailand, Turkey, Ukraine, and the Palestinian territories. The aim of the survey was to measure worldwide public opinion on media freedoms. The most important finding of the survey was the majority's support for the media to be free to publish news and ideas without government control." While 81% of the respondents found this argument "important," 53% of them thought it was "very important." On the issue of Internet censorship, on average 62% of participants stated "people should have the right to read whatever is on the Internet." On the other hand, 30% of them said that the government should have the right to "prevent people from having access to some things on the Internet." The majority of public opinion (51%) held the view that they would like their media to have more freedom, while only 14% favored less freedom. The survey also questioned how free the media are in the participants' own countries. Across all nations polled, a majority said that media in their country have either "a lot" of freedom (30% across countries) or "some" freedom (41%). In five of the countries including Turkey, support for more media freedom is the most common response, but not a majority. In Russia (39%), Ukraine (45%), Turkey (38%), Thailand (44%) and India (36%), the publics seem to recognize that media freedom is at least somewhat limited; they also said that media freedom was

important, but a majority of the people were not demanding more (*December 2008 Report* of *World Public Opinion* and *the Universal Declaration of Human Rights*).

In another series of survey done by "Kadir Has University's Turkey Research Center" titled *Social and Political Trends in Turkey*, the findings concerning democracy, freedom, and media show that levels of discontent remain high. In the last five years, a gradual decline detected on the perceptions of Turkish public regarding the situation for democracy, freedom of thought, and freedom of the media in the country. 2015 results of the survey indicate that when asked whether they think "There is free speech in Turkey", the rate of participants saying "Yes" went down from 30.8% to 27.5%, while those saying "Yes" to "The media in Turkey is free" went down from 38.5% to 24.6%, compared to the previous year. On the other hand, only 20% of respondents believe that "Turkey is a democratic country" as opposed to 30.3% of them stating "Democracy is getting weaker." This opinion of Turkish public seems to be confirmed globally as well. The Freedom House changed Turkey's press freedom status from "partly free" to "not free" in 2015, and in 2016, the status of the country is still "not free." And according to the 2016 World Press Freedom Index, Turkey ranked 151st of 180 countries.

Media Freedom and Censorship in Turkey

The efforts to curb discussion and press freedom in Turkey are not a new phenomenon. The regulation of the media is made with the implementation of various laws and legislations in the country. Article 28 of the Turkish Constitution states, "the press is free and shall not be censored." But the judiciary of Turkey can censor all media outlets under constitutional provisions and loosely interpreted laws, especially on the grounds of "protecting basic characteristics of the Republic" and "safeguarding the indivisible integrity of the State with its territory and nation." Guarantees provided by the Constitution are eroded time to time by confining provisions in the Criminal Code, Criminal Procedure Code, and anti-terrorism laws, leaving discretion to prosecutors and judges.

Turkey's legal framework regulating the freedom of expression and freedom of press, consists of the Press Law (The 2004 Press Law No. 5187) and the Law on the Establishment of Radio and Television Enterprises and Their Broadcasts (the RTÜK Law). Broadcasting of Turkey is regulated under the supervision of the Radio Television Supreme Council (RTÜK), which was established by the Radio and Television Law (Law No. 3984) in April, 1994. The issued law regulates private broadcasting and to control compliance of broadcasts with legal framework, while the RTÜK is responsible for assigning frequencies and issuing broadcasting permits and licences to private companies. The Council also holds an authority of giving penalties (for breaching the legal framework) to the broadcasters, which may range from warning to the suspension of the TV and radio channels (OpenNet Initiative, 2010).

Everyone should have a right to access information in democratic societies and states have a responsibility to provide citizens' access to the Internet is guaranteed. Internet access policies, defined by governments, should be in line with the requirements of Article 19 of the Universal Declaration of Human Rights as well as Article 19 of the International Covenant on Civil and Political Rights and (where applicable) with Article 10 of the European Convention on Human Rights. While certain countries and international organizations, such as the United Nations, may recognize Internet access as inherent to the right to free expression, some other governments have adopted policies to block access to the Internet (OSCE Report on Freedom of Expression on the Internet).

New media is regulated with older laws as well as the new laws enacted specifically to control the digital media in Turkey. Law No. 5651 (also known as the Internet Law of Turkey) was passed by the Turkish government in May 2007 to regulate crimes committed via the Internet (Freedom House, 2011). The law governs "the regulation of publications on the Internet and fighting crimes committed through these publications." According to the law, the Telecommunications Communication Presidency (TIB) was authorised to execute court orders to block websites and to issue blocking orders for the content providers

in or outside Turkey for committing crimes such as child pornography, encouraging drugs and, especially, crimes against Ataturk.

The 2004 Press Law No. 5187 repealed the former Press Law No. 5680 and its amendments, which brought Internet broadcasting under the press legislation, meaning that websites and Internet service providers' monitoring standards were criticized for being incompatible with the characteristics of the Internet (OpenNet Initiative, 2010).

RTÜK (Radio and Television Supreme Council) and a new governmental association, TIB (Telecommunications Communication Presidency), can impose bans on Internet sites without prior judicial approval, if the offending Web site hosts content that is illegal under Turkish law and is hosted outside Turkey, or a Web site contains sexual abuse of children or obscenity and its host resides in Turkey. The Information and Communication Technologies Authority and the TIB, which it oversees, act as the regulators for all of these Technologies. However, the fact that board members are government appointees is a potential threat to the authority's independence, and its decision-making process is not transparent. TIB also oversees the application of the country's website-blocking law, and is often criticized by pressure groups for a lack of transparency (Freedom House, 2011).

The RTÜK, and a new governmental association, Telecommunication and Transmission Authority are authorized to ban Internet websites without prior judicial approval, on the following conditions:

"(i) if the 87 offending Web site hosts content that is illegal under Turkish law and is hosted outside Turkey, or (ii) a Web site contains sexual abuse of children or obscenity and its host resides in Turkey. They also focus on crimes against Mustafa Kemal Atatürk, the offering or promotion of prostitution, provision of place and opportunity for gambling, unauthorized online gambling and betting, sexual abuse of children, encouragement of suicide, supplying of drugs that are dangerous for health, and facilitation of the abuse of drugs" (OpenNet Iniatitive, 2010).

In addition to these, they may block websites for the following:

"downloading of MP3 and movies in violation of copyright laws, insults against state organs and private persons, crimes related to terrorism, violation of trademark regulations, unfair trade regulated under the Turkish Commercial Code, violation of Articles 24, 25, 26, and 28 of the Constitution (freedoms of religion, expression, thought, and freedom of press)" (Ibid.).

All Internet traffic passes through Turk Telecom's infrastructure, allowing centralized control over online content and facilitating the implementation of shutdown decisions. The government attempts to regulate the Internet through bans applied by government regulatory bodies such as the Turkish Information and Communication Technology Authority, and the recent Internet law, which became effective in February 2014. The law authorized the telecommunications authority (TIB) to block any website within 4 hours without first seeking a court ruling, and requires Internet providers to store all data on web users' activities for two years and make it available to the authorities upon request (Letsch, 2014). The law allows the blocking of entire sites, not just pages, by court order. With this law, social networks have, on occasion, had their access revoked.

Since 2007, the blocking of social platforms in Turkey has occurred on separate occasions, mostly because of a circulation of incendiary or offensive content to Turkey or to Turks.The blanket ruling of the Turkish Information and Communication Technology Authority led to the banning of YouTube, first in 2010. The YouTube ban came into effect after the release of several videos related to anti-secular speeches made by several prominent AKP figures, including Prime Minister Tayyip Erdoğan and President Abdullah Gül. The ban was lifted several times by different courts but enacted by other district courts. People found ways of bypassing the ban using proxy sites and the prime minister even declared that he could access YouTube. The ban was lifted close to the general elections of June 2011. Yet the government silently introduced a blanket filter in August 2011 that affected every Internet user in Turkey

(*Today's Zaman*, 2011). The aim of the government, as it was argued, was to protect young children from sex, drugs, and violence on the Internet. The protesters interpreted the move as anti-democratic, because it would operate as a blanket ban covering everyone without their consent. Due to protests on the ban, the government took a step back and made filtering voluntary. Examples of websites being blocked in 2011 and early 2012 include the media streaming service Livestream, pastebin.com, popular file sharing services Rapidshare.com and Fileserve.com, Wix.com (a popular website builder owned by an Israeli company), Blogspot (based on a request by the satellite television provider Digiturk; according to Digiturk Blogger was being used to distribute material it holds the broadcast rights to), as well as Google Apps hosted websites, including all Google App Engine powered websites and some of the Google services. Today there are thousands of sites that can be seen from the rest of the world but not from Turkey, because government agencies block them (*Hurriyet Daily News*, 2011).

On 24 January 2014, the Turkish government cut the access to SoundCloud website after a user named "haramzadeler" (*"illegal ones" in Turkish*) uploaded seven secretly recorded phone call tapes which expose private conversations between the Prime Minister Erdoğan and others, including: Erdoğan Bayraktar, local politicians, some businessmen, PM's daughter Sümeyye Erdoğan and his son Bilal Erdoğan (Hogan, 2014).

On 20 March 2014, Twitter was closed as a result of court order stating that "protection measures" be applied to the service. This followed earlier remarks by Prime Minister Tayyip Erdogan who was sworn to "eradicate Twitter" allegations of corruption in his inner circle (*PC World*, 2014). At around the same time, Google Public DNS was also blocked, and doing that, Turkey became the first country ever to ban Google DNS (Arlı & Özçelik, 2014). A week later on March 27, YouTube was blocked one more time because of revealing a secret National Security meeting conversation among Head of Turkish Intelligence Hakan Fidan, Turkish Foreign Minister Ahmet Davutoğlu, and others, plotting "false flag" operations in Syria. While Prime Minister Erdoğan argued that the leak was "villainous"; Davutoğlu called it "a cyber attack against the Turkish Republic" and "a declaration of war against the Turkish state and our nation" (*Today's Zaman*, 2014).

Twitter ban was lifted by the constitutional court of Turkey on April 2nd, ruling "the embargo is the violation of freedom of expression and individual rights ." Prime Minister Erdoğan commented on ruling by stating that he does not respect the court's ruling. YouTube ban remained effective in the country by June 1st, 2014. It was reported that in the second half of 2014, Twitter received more requests from Turkey – through Government channels of by court order – to remove content, than from any other country; and complied with nearly half of those requests (Doğramacı & Radcliffe, 2015).

In the third quarter of 2015, *Bianet* recorded a strengthening of attacks on the opposition media during AKP interim government, with the censorship of 101 websites, 40 Twitter accounts, 178 news; attacks against 21 journalists, three media organs, and one printing house; civil pursuits against 28 journalists; and the six-fold increase of arrests of media representatives, with 24 journalists and 9 distributors imprisoned (*Bianet*, 2015).

Another problematic area in Turkish media is media ownership. 70% of the media, including national newspapers, radio and TV stations are owned by few cross-media groups in Turkey. The activities of these conglomerates expand to other sectors beyond media such as tourism, finance, automotive, construction and banking. And in order to protect their business interests, these media groups adopt a government friendly approach in reporting and broadcasting. On the other hand, knowing this vulnerability of the media, the government does not avoid using the financial and other leverage it holds over media owners to influence coverage of politically sensitive issues. As a result of the pressure, several dozen journalists, including prominent columnists, lost their jobs and those who remained had to operate in a climate of increasing self-censorship and media polarization (Freedom House, 2015). Within this context, self-censorship also has become a common practice in Turkish media.

The mechanisms used by the government to control the new media in Turkey have a chilling effect on freedom of expression, which is one of the founding principles of democracy. As in the case of YouTube, blocking websites could be incompatible with Article 10, and could be regarded as a serious infringement on freedom of speech, and too far-reaching than reasonably necessary in a democratic society. The fact that society may find speech harmful and offensive should not be a sufficient reason for suppressing that content, such as in the case of YouTube. In fact, such speech and content may be protected by Article 10, ECHR, and the related jurisprudence of the European Court of Human Rights. It is obvious that the illegal content does not vanish as a result of blocking access to websites. Those who live outside Turkey or those who know how to access YouTube and other banned websites from within Turkey can still access the suspected content (OSCE Report on Freedom of Expression the Internet). Banning socially useful websites is also damaging for political expression. These sites provide a venue that is popular across the world for alternative and opposition views.

Conclusion

Preventing public's access to information is a violation of fundamental rights and freedoms while the states have a responsibility to provide citizens' access to the information. With the opportunities provided by technology, the technicalities of access bans can be overcome using a number of alternatives already available. This inconsistency decreases the position of the laws and legislations issued to regulate the Internet, in the eyes of society, while the censorship itself harms the image of countries as democratic nations.

Based on legal and procedural deficiencies related to Law No. 5651 in practice, it is advised that the Turkish government should amend this Internet Law in line with international standards on freedom of expression, independence and pluralism of the media, and the free flow of information. Media Association of Turkey (2010) suggests that "this process of amendment should be conducted via a transparent, participatory and pluralistic method that respects the right of adults to freedom of thought and access to all forms of Internet content." In a parliamentary system, public opinion is an important check on political power. Therefore, the opinions of public should also be taken into consideration during the revision process of the law.

The establishment of the Courts dealing only with the cases of Internet affairs is also important. There is also a need for judges, prosecutors and experts educated in new media law.

Courts specializing in Internet affairs must be established. Internet journalism should be defined and its journalists should be recognized and fully accredited by public institutions and establishments. Courts dedicated to the Internet are a necessity, along with judges, prosecutors and expert witnesses who specialize in online affairs.

The future of Turkey as a democratic country will depend on to what extent the government will value the concerns and criticisms made for protection of fundamental rights and freedoms. Turkish society also has to decide on how much balance of security and freedom of expression is right for their nation. Media, on the other hand, should act as the fourth estate by exercising its check and balances function in the country.

Determination of the Amount of Maintenance Obligations in the Czech Republic

Martina Hedvicakova, University of Hradec Kralove, Faculty of Informatics and Management, Rokitanskeho 62, 500 03 Hradec Kralove III, Czech Republic, martina.hedvicakova@uhk.cz

Margareta Munsterova, University of Hradec Kralove, margareta.munsterova@uhk.cz

Abstract

Maintenance debts in the Czech Republic are constantly on the rise. Political parties strive to find a way to deal with this issue. Also, the Czech Republic is one of the few European countries with no minimum child maintenance amount. Seven years ago, the Ministry of Justice under the leadership of Minister Kovářová only introduced tables as recommended materials for parents and for courts in their decision-making. At present, these tables are not in use. For this reason, Minister of Labour and Social Affairs, Michaela Marksová (ČSSD) submitted to the government a draft act on so-called "advance maintenance" which suggests that the government would cover maintenance for a common child to one of the parents, to whom the other parent owes alimony. This draft was rejected by the opposition and even by single mothers. The objective of the present article is to draw the attention to maintenance obligation issues and, based on statistical data, to analyze the actual maintenance obligations of fathers and mothers in the Czech Republic.

Key words: maintenance obligations – support – social system – family law

1. Modification of the Maintenance Obligation in the Legislation

The basic source of legislation modification of family law is the Charter of Fundamental Rights and Freedoms, which enshrines the legal protection of parenthood and the family, provides special protection to children and adolescents, and special care and protection to pregnant women. Before the law, children born within marriage and out of wedlock are equal.

Another important source is the Convention on the Rights of a Child, in our country published under no. 104/1991 Coll.

By the effectiveness of the new Civil Code no. 89/2012 Coll., the Family Act no. 91/1998 Coll. lost its effectiveness. Legislation modification of family law is therefore incorporated into the new Civil Code. (Munsterova, Hedvicakova, Pozdilkova, 2016)

2. Terms and Conditions Relating to the Maintenance Obligation of Parents to Children

Maintenance obligation of parents to children is the most important and the most significant type of maintenance obligations, the law ranks this obligation in first place among other kinds of maintenance obligations. (Munsterova, Hedvicakova, Pozdilkova, 2016)

When determining the maintenance, financial circumstances of the debtor are crucial. The concept became part of the Act through the amendment from 1998 and it is also part of the new Civil Code. The Act is based on the fact that when evaluating financial circumstances of parents, it cannot be based solely on factual proved income, but it is necessary to assess and take account of the overall property situation of the liable parent and the manner of their life. The Court in that case therefore evaluates ownership of movable and immovable assets, overall way of life e.g. expensive hobbies, spending on expensive holidays etc.

This statutory criterion therefore allows the courts during determining the maintenance to also take into account any property acquired by inheritance, restitution, prize etc.

For a liable parent who is e.g. unemployed although working illegally, the court has the opportunity to evaluate their earnings ratio of the so-called fictions. The court in similar cases is based on the so-called notional income of the liable parent in a way that in collaboration with other government agencies demonstrates the potential income of the parent with regard to their level of educational attainment, health status, duration of current practice, etc.

In determining the amount of maintenance, the court is obliged to take account of obligations of the liable parent, i.e. credits, loans etc. These commitments of the liable parent, however, do not have a significant influence on determining the amount of maintenance obligation of a minor, because the performance of maintenance obligation is legally considered as a priority claim with respect to the protection of minor children.

The Act also obliges the courts to take into account the fact that a liable person personally cares for the minor and the extent to which they do so.

In judicial practice it is generally argued regarding a child at an early age, the maintenance obligation of a parent who personally cares for the child, is completely compensated by personal care. For this reason, the court does not determine the maintenance obligatory to a parent to whom the child was entrusted to education.

The amendment to the Family Act of 1998 introduced the institutes of shared and joint custody of parents of minor children into the family law regulation.

The new Civil Code took over this legislation and continues to provide that the court may entrust a child to one of the parents, or shared custody or joint custody.

Raising a child jointly after divorce essentially means nothing other than the relationships to the child are not specifically defined. Raising a child jointly is based on the fact that parents even after the divorce, jointly live and raise a child as well as take care of them. For this reason, courts usually do not provide maintenance obligations for the child.

Scientific debates however differ the views on this issue, some authors tend to believe that the approval of such agreement is not possible, they argue that shared care basically means that the situation of a child is actually not regulated and also draw attention to the pressing issue in the case of performing an enforcement.

A different situation arises in the case of a decision on shared custody by parents of a minor child. Placing a child in a shared care means that after a certain period of time the child is in education of one parent and in the next period of time in the education of the other parent. These periods of time may be in the order of days, and for smaller children up to weeks or months.

In terms of determining maintenance, in these cases, there isn't a uniform practice and opinion on how it should be performed. The Act does not expressly state anywhere how to decide on maintenance in the case of shared custody, same as it is not provided with joint care.

If the court finds out comparable asset situation with both parents, the court usually doesn't determine the maintenance. In the case of greatly differing earnings ratios, the court determines the maintenance in different amounts, as possible by the financial circumstances of the liable parent.

3. Average Amount of Maintenance and Support in the Czech Republic

"Following the Czech Statistical Office, 57 percent of divorces are represented by marriages with minor children. Thirty-nine to fifty percent of the parents fail to pay maintenance. According to the Ministry of Labour and Social Affairs, unpaid alimonies concern around 55 thousand Czech children. However, these data omit an essential component – i.e. partners who only break up after making children together, without any agreement on maintenance payments. For this reason, Lucie Asenová, Chairwoman of Incomplete Families Association, reckons that actually up to 90 thousand children are affected by this issue every year. Sledova (2015).

To improve the current situation, Minister of Labour and Social Affairs, Michaela Marksová (ČSSD) submitted to the government a draft act on so-called "advance alimony" which suggests that the government would cover maintenance for a common child to one of the parents, owed by the other parent..

However, this proposal is rejected by the opposition and even by single mothers. Based on it, they would only get in on the money after nine months.

The following Table 1 specify the Average amount of maintenance and support in 2010 - 2014.

Tab. 1: Average amount of maintenance and support in 2014: In case of divorce - the following have the duty to support and maintain

Age of the child in years	Maintenance and support	2010 (CZK)	2011 (CZK)	2012 (CZK)	2013 (CZK)	2014 (CZK)
- 5	Mother	986	1,083	1,188	1,272	1,340
	Father	2,634	2,650	2,704	2,770	2,836
6 - 10	Mother	1,250	1,275	1,352	1,325	1,550
	Father	2,842	2,987	3,051	3,087	3,204
11 - 14	Mother	1,485	1,513	1,606	1,623	1,650
	Father	3,144	3,137	3,397	3,463	3,569
15 - 18	Mother	1,802	1,870	1,872	1,824	1,971
	Father	3,444	3,572	3,618	3,777	3,866

Source: Ministry of Justice, Czech Statistical Office (2016)

If we focus on the average values of maintenance in the Czech Republic in 2010 and 2014, we see a slight increase both on mothers' and on fathers' side. The average maintenance in 2010 amounted to CZK 1,381 = EUR 54.60 for mothers and to CZK 3,016 = EUR 119 for fathers based on the exchange rate in 2010 (exchange rate of the Czech National Bank in 2010 was 1 EUR = 25.29 CZK). In 2014, the average maintenance amounted to CZK 1627.75 = EUR for mothers 59 and CZK 3,368.75 = EUR 122 for fathers (exchange rate in 2014 was 1 EUR = 27.533 CZK).

In total, debts on maintenance reached CZK 13 billion in 2013. The Czech Republic has, as one of the last European countries, no minimum child maintenance amount in place.

Seven years ago, the Ministry of Justice only presented the following tables as recommended materials for parents and for courts in their decision-making. However, the tables in principle are currently not in use. Some parents argue with them as proof, however, for courts this document is not binding and generally they are not governed by it. (Munsterova, Hedvicakova, Pozdilkova, 2016)

If a parent fails to pay maintenance for a child and no consent can be achieved, the other parent has only two possibilities:

- to file a proposal for execution of judgement at the relevant District Court relevant to is/her residence;

- if the other parent of the child has failed to pay maintenance for 4 subsequent months, a criminal charge can be brought against him/her for evading the maintenance obligation; in this case, the parent in question may be sentenced to imprisonment without parole.

4. Discussion and Conclusion

The present paper has outlined the some key problems of determining the amount of maintenance obligations in the Czech Republic. As one of the last countries of the European Union, the Czech Republic has no minimum amount for maintenance in place.

Further research will explore the minimum amounts of maintenance in the various European Union member countries and subsequently, they will be compared with the average wage of in the relevant country. Following research will also evaluate these data in the view of the Human Development Index. Authors will also be concerned with methods of suppressing failure to pay maintenance applied by the various EU member countries with possible application in the Czech Republic.

Another area that could improve the current situation is the availability of administrative databases and the possibility of connection and information on the sub-characteristics of the divorced (information about the use of time, maintenance, monitoring the divorced after another marriage). Munsterova, M., Hedvicakova, M., Pozdilkova, A. (2016)

If a country's economy is supposed to grow, it also needs to address the issue of maintenance obligations.

Acknowledgement

The paper was written with the support of the specific project 2016 grant "Determinants affecting job satisfaction" granted by the University of Hradec Králové, Czech Republic.

Abstract

The Business process concept plays a major role in the Information System (IS) domain. Business Process Management (BPM) approaches offer languages, methods and tools for modeling, execution and optimizing business processes. However, these approaches are often difficult to understand by the learners. In particular, the modeling phase often remains abstract, not consensual and complex to implement in real settings. In order to better motivate BPM learners, several BPM's Serious Games (SG) has been developed in recent years. But few studies have evaluated game based educational methods for the BPM learning. This paper presents a feedback on the SG INNOV8 use in BPM teaching. INNOV8's evaluation was conducted within the course: "Information System Design," proposed to Master students. The feedback from the students and teachers were quite positive. Nevertheless, the study shows a low potential of the game for novice students in this field.

Keywords: Serious Games, Innovation in learning, Flow, Business Process Management

Introduction

Today, Serious Games (SGs) are known as a new and promising instructional method for educational institutions (Michael et al. 2006) (Aarseth 2005).

SGs are video or computer games designed for training or educational purposes (Alvarez 2007). SGs are used as a means of meeting learning objectives such as training, simulation, education, promotion, communication, etc. They are adopted in the Environments for Human Learning (EHL) by combining machine-mediated learning, simulation, use of emotions and professionalism. Thanks to the combination of seriousness and fun, the motivation and perceived ability of individuals to process complex information or to repeat behaviors have been improved (Kebritchi et al., 2010).

In recent years, the field of SGs has grown exponentially and has been used in a wide range of application areas like management, health care, defense, industry, civil security, military training, computer science, Information system and science (Kato et al., 2008)

In the Information System (IS) field many serious games, have been developed such as INNOV8[1] and iseamethod[2] for Business Process Management (BPM), SharkWorld[3] for Project Management and Keep an Eye[4] for corporate security awareness.

Despite the variety of the developed SG, to the best of our knowledge, only a few studies have been conducted to assess the games' degree of efficiency in achieving the implied added value in IS learning (Michel et al., 2010; Boughzala et al., 2013). The use of such SGs requires a theoretical framework to evaluate their strengths and weaknesses.

This paper tries to bridge this research gap by providing a feedback on the use of INNOV8, a SG developed by IBM BPM for Business Process Management learning. We aim to answer "partially" to the following questions of our research program:

- Is it appropriate to use SGs to teach BPM concepts?
- To what extend does SG contribute to BPM advanced learning?
- How to integrate SGs in the DM learning?

This experiment was conducted in the context of the course "Information System Design" taught in Master I of a French Business School. INNOV8 was designed to train students and employees to process modeling and optimization. We aimed to enhance the conventional course learning methodology, namely: core modeling concepts presentation, readings and case studies, in order to study the potential contributions of this SG. We have adopted three theoretical frameworks spanning the pedagogical, psychology and aesthetic dimension in order to assess the SG INNOV8.

The remainder of the paper is organized as follows. In section 2, we present the literature review related to SGs area: definitions, related works on SGs related to the BPM domain and learning theories for SGs evaluation. In section 3, we introduce the method adopted in this research to conduct the experiments. Section 4 describes the tested INNOV8 module: Smarter customer service. In section 5, we present the research findings. In section 6, we discuss the findings and we introduce a methodology to integrate INNOV8 in the BPMN learning. The conclusion discusses contributions, limitations and future research directions.

1. Background and Related Work

1.1. learning through Serious Games

There are several SG definitions in the literature. SGs are a kind of “computer games designed for training or educational purposes” (Kebritchi et al., 2010). SGs are games “in which education (in its various forms) is the primary goal, rather than entertainment” (Michael and Chen, 2005) to deliver engaging interactive media to support learning in its broadest sense. Alvarez (2007, p. 25) defines SGs as “*computer applications having as original intention to combine both serious aspects […], with fun aspects from video games. Such an association is achieved by providing a learning scenario corresponding, from a programming point of view, to implement a decor (sound and graphics), story and suitable rules; therefore it moves away from restricting the game to entertainment*.”
The main goal is to operate the entertaining aspect of video games to facilitate the learning of serious concepts which are traditionally taught with conventional teaching or training methods.

Several studies have analyzed the contributions of SG for learning (Michel et al. 2009) (Corti 2006) (Gee 2003) (Karoulis 2005). The success of these training schemes is linked in particular to their captivating and entertaining in nature. These factors are particularly important on a target learners accustomed from an early age to handle technological tools and video games. This intensive use games and technology have led to the concept of learning by the video game: Digital Game-Based Learning (DGBL) (Prensky, 2001).

(Ribeiro et al. 2012) have specifically analyzed the contributions of the SG to the field of BPM. They show that traditional ways of learning (courses, exercises, case studies, etc.) have several limitations. Indeed, BPM environments offer simplistic simulations of business processes do not take into account possible interactions of users during these simulations and their interfaces are generally complex and abstract learners requiring training (West, 2010). Thus SG are seen as a promising approach to learning and simulation of business processes due to the immediate experience feedback, active participation in the game and simulation of real business situations (Fu, 2009).

1.2. theoretical frameworks for sg assessment

According to (Yusuf, 2010), three main dimensions were used for the evaluation of SG namely: the educational dimension where learning theories are considered, the psychological dimension that represents the factors that make it challenging and attractive game, and IT perspective specifying the tools and technologies to improve the efficiency of learning.

In this section we present the main theoretical frameworks that we have selected for the evaluation of the above dimensions.

1.2.1. Pedagogical dimension: Bloom's taxonomy (Bloom et al, 1956.)

In this framework, the fundamental aspect of learning is to ensure that learners do not just expect to memorize learning, but must be able to apply them and make judgments about the subject area. The assessment of learning techniques, according to the classification of Bloom, to ensure that learning is effective, is measured through six criteria for which the learner's capabilities are enabled:

- **Knowledge**: The learner can recall information,
- **Understanding**: The learner can explain and predict,
- **Application**: the learner can solve problems and use information,
- **Analysis**: the learner can observe patterns and understand concepts,
- **Synthesis**: the learner can create a new structure, assemble several elements to form a whole,
- **Evaluation**: the student can compare and make judgments about the value of ideas or materials.
-

1.2.2. Psychological dimension: The optimal experience (flow or state)

(Csikszentmihalyi and Patton, 1997) define the concept of "flow" as the subjective state of feeling good. The flow often occurs when there is a perception of a balance between personal skills and the demand for the task. This theory is increasingly present in the scientific and professional literature concerning the creation of video games, for causing flow state is exactly what designers seeking to provide players: this helps to increase both their pleasure and their persistence in the game. Often the concepts proposed to evaluate the flow are strongly linked to the "entertainment", "fun" and "enjoyment" concepts. (Heutte et al., 2014)

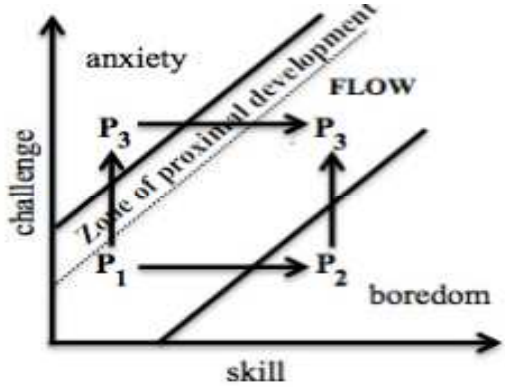

Figure 1: The extended three-channel model of flow skills (Csikszentmihalyi, 1990)

1.2.3. Aesthetic dimension: evaluation of learning tools (Almerico et al., 2004)

It corresponds to the artifact component supporting the actions of players. These components are typically used to assess the aesthetic dimension of learning tools.

Table 1: Sample evaluation criteria learning tools

CRITERIA	COMPONENTS
Scripting	Definition of pedagogical scenario
Graphic Information	art, drawings, diagrams, displays, graphics information
Interaction	demonstrations, experimentation, group discussions
Multimedia	Animation, Sound, Video
Text information	Arguments, recommendations, definitions, rules

These theoretical frameworks have been mobilized in the assessment of SG INNOV8 used in our experiment.

2. Methodology

2.1 sample

A total of 249 Master I students participated in this research project, which was conducted during the last session of the course "Information System Design" in a French business school. The students were involved in a test in situ (see section 2.2).

The conventional format of the course involves small groups of students (N = 50), which interact with teachers in solving modeling exercises and in case studies analyses.

As can be seen in Table 2, the average age of students is 22 years, there were slightly more females in the sample and 81, 52% of students have used an SG as part of their curriculum.

Table 2: Sample

VARIABLE	RATE
Total participants	249
Gender : Males Females	 109 (43,77) 140 (56,22 %)
Average age	22 ans
Experience with SG	203 (81,52%)

2.2 serious game selection: INNOV8

INNOV8 is an SG developed by IBM in 2007 as part of their "Academic Initiative" program. IBM has developed a second version in 2009 used by many universities worldwide. Version 2.0, which was selected in our experiment, is a 3D game for business process modeling[1] and optimization. INNOV8 offers to the learner an avatar to meet various stakeholders of a fictitious company "After Inc" and to collect different information from the multiple company services. It is a single-user system, where the player takes the role of a consultant who has to model and reconfigure the process of a call center to optimize the company business processes (see Figure 1).

[1] with Business Process Model and Notation (BPMN). www.bpmn.org

Figure 1: INNOV8 screenshot

In order to achieve its mission, the player has to complete certain tasks and collect information from other actors from different departments of the company, throughout the scenario, the player has to:

- Choose the right strategy to meet specific needs,
- Choose the budget to be allocated to different sectors of the company,
- Reconfigure a process to achieve specific goals,
- Interview company employees to get information

The player controls his character, while other characters are present in the company. Advices are given to the learner throughout the scenario, such that finding documents or interviewing other virtual employees. In most cases, following these dialogues, important information is communicated to the user in order to make decisions. Information provided during the interviews is very often keys to find the optimal solution to the problem. Indeed, it is often necessary to find a tradeoff i.e. a tradeoff between the number of employees to be assigned to a certain task and the level of their skills under a budget constraint. Afterwards the player's decisions are simulated (3 attempts) before submitting its response. A non-optimal solution impacts on the entire business process.

2.3 procedure

The teachers involved in this experiment informed their students about the Serious Game session. Students were asked to form groups of four to five, and the game rules were explained by the teachers. The link between INNOV8 and the lecture material of the last course was also highlighted to legitimize the use of this SG. Each student group was provided with one copy of INNOV8. A time limit of 90 min was imposed.

Teachers observed and recorded comments during the session without intervening to assist learners. At the end of session, learners were invited to complete a survey to assess pedagogical, aesthetic and psychological (Flow) dimensions of the SG.
A debriefing session on this experiment was carried out by teachers of each group to discuss the acquired knowledge, clarify links with the theoretical courses and practical exercises as well as to collect learner's feedback on the SG.

2.4 measures

All measurements were made in the same way: a list of items for which respondents were asked if they were "strongly agree" or "not at all agree" according to a Likert scale in five steps.

For the evaluation of educational benefits of the use of SG, we were mainly based on the update of Bloom's taxonomy (Anderson et al., 2001) which is among the most widely used framework for describing learning objectives.

We adopted a list of action verbs (see Table 3) based on Bloom's taxonomy proposed by (Almerico et al., 2004; Illinois Central College, 2011) to assess the pedagogical dimension of the SG.

Table 3: Action based learning (Almerico et al., 2004; Illinois Central College, 2011)

ACTION LEARNING	
CATEGORIES IN BLOOM TAXONOMY	**ILLUSTRATIVE VERBES**
Remember (knowledge)	Define, describe, find, watch, match, connect, reproduce, select
Understand	Compare, convert, demonstrate, discuss, explore, generalize, interpret, reformulate
Apply	Illustrate, interpret, select, classify, resolve
Analyze	Compare, deduce, discover, explain, identify
Assess	Argue, choose, discuss, decide, justify
Create	Design, imagine, predict, plan

To assess the technological dimension, we have adopted the criteria proposed by (Carvalho et al, 2015), namely: graphic design, interaction with onscreen user, multimedia and text illustrations.
To measure the flow, we relied on a scale of 18-item proposed by (Kiili et al., 2014). These items were derived from the GameFlow survey (Kiili et al., 2008) and the FSS-2 survey (Fournier et al., 2007).

This survey is organized in 9 dimensions: the challenge, clarity of objectives, feedback, playability, concentration, time distortion, the rewarding experience, self-loss of consciousness and the sense of control.

3. Results

3.1.1. "flow" Assessment

Table 4 shows that the dimensions "challenge" and "self-consciousness of loss" have been well evaluated. Although the "playability" dimension shows the lowest average, learners were captivated and totally immersed in the experimental session and showed significant ownership of their accomplishments.

Table 4: Assessment of the Flow

Flow dimensions	Mean	SD
The challenge	**4,46**	**0,73**
Clarity of objectives	**3,66**	**0,83**
The feedbacks	**3,84**	**0,89**
Concentration	**3,45**	**0,87**
Gameplay	**3,1**	**0,98**
The rewarding	**3,74**	**0,99**
Time distorsion	**3,71**	**0,81**
The sense of control	**3,5**	**1,11**
The loss of self-awareness (Immersion)	**4,05**	**0,73**

3.1.2. Learning assessement

The learning dimension of the SG was well assessed by the learners. The responses were quite homogeneous. Learners appreciated the mission as it corresponds to a professional situation. The reconfiguration of the company's business process was particularly appreciated by learners (M = 4.38; SD = 0.47).

Table 5: Assessing learning

Bloom's taxonomy Criteria	Mean	SD
Remember (knowledge)	**4,11**	**0,66**
Understand	**3,66**	**0,83**
Apply	**4,05**	**0,73**
Analyze	**3,9**	**0,6**
Rate	**3,94**	**0,58**
Create	**4,38**	**0,47**

3.1.3. Aesthetic dimension assessment

We found that the aesthetic aspects and especially the graphics and multimedia dimensions were not well evaluated. The learners are used to video games with sophisticated design. Nonetheless, textual illustrations and user interaction were well evaluated. Learner found that the navigation across the virtual universe of the company After Inc was quite easy.]

Table 6: assessment of the aesthetic aspects of the SG

Aesthetic aspect of the game	Mean	SD
Graphics	**2,1**	**0,5**
Interaction with users	**2,9**	**0,4**
MultiMedia	**2,1**	**0,6**
Textual illustration	**3,9**	**0,5**

4. Discussion

This research study sought to ascertain whether INNOV8 triggered higher levels of learning and flow amongst learners compared to 'conventional' tutorial activity, whereby students might do casework, resolve modeling exercises. Our results indicate that the use of SG resulted in increased levels of learning and flow.

The analyses of our results clearly show the suitability of the SG as a learning device suitable for new generation of learners. The use of SG proved relevant in the context of the IS design course. We analyze in this section our experimental results and we compare them with the theoretical framework discussed in Section 1.

4.1. the serious game as a catalyst learning by doing

The main contribution of the SG usage was a clear learner's involvement in the scenario of the game i.e. we have noticed that learners were asking questions, exchanging within their group, debating to choose the right Business process configuration. These aspects are essential in the theoretical framework of learning (Kolb and Kolb, 2005) as well as in Bloom's taxonomy.

Table 7: Comparison of research results to Bloom's taxonomy (Bloom et al, 1956.)

Criteria	Evaluation	Illustration
Knowledge	Yes	The player is called to remember the information provided by the players to continue the game.
Comprehension	Yes	The player explains his choice modeling to optimize business processes.
Application	Yes	Design choices are applied taking into account several parameters (call costs, many operators ...) to improve the center's performance.
Analysis	No	
Synthesis	No	
Evaluation	Yes	The game includes a progress bar indicating the learner where he stands in relation to the purpose of his mission. The last stage of the game during which the learner varied certain indicators to improve the performance of the call center, assesses knowledge of the learner, stating the success or failure of his mission.

This evaluation highlights that INNOV8 offers integrated functionality allowing the learner to use the knowledge presented by the players of the game to offer a business process design template which is then applied to optimize the processes of the call center. Thus criteria: knowledge, understanding and application of taxonomy are covered.

The evaluation of the taxonomy criterion is also taken into account since the learner is assessed throughout the game via a progress bar as well as an assessment indicating the success or failure of his mission.

We note the lack of features on the criteria for analysis and synthesis of taxonomy. In fact, the game does not explicitly generalize and synthesize the results of the mission.

4.2. the serious game as a catalyst of motivation

The pleasure of playing leads to enjoying learning. The results showed a strong commitment and a strong interest of learners in the use of Serious Games as part of this course.
However the video aspects, graphics and sound, have been developed in recent years, learners have been disappointed in comparison with the games they used to practice outside the classroom. Some learners were very disappointed by the graphics aspects.. However, they prefer this mode of learning, in which they are active, compared to traditional modes in which they are generally passive.

4.3 the serious game has to be integrated within a conventional course format

INNOV8 was appreciated in the context of applying the theoretical concepts of IS design concepts. However, the game did not provide theoretical knowledge. Thus, we have imagined a new course design method in order to integrate this SG within the IS design course. We have therefore proposed the following agenda (see figure 2).

The SG will be used in two distinct periods of training. First, after the introduction of Business Process Management theoretical concepts. This first experience of the SG will be the opportunity for the learner to discover, through this virtual environment, the various concepts and models studied during the first stage of the course. This will initiate the reconfiguration and process optimization through its first virtual junior consultant experience. After this introduction to SI consulting business, exercise sessions and case studies will be conducted in small groups to deepen some aspects of the audit, reconfiguration and optimization process. This group work, will allow participants to be active in their learning and learning by doing. In the final stage of training, when the learner has acquired extensive knowledge on process management, the Serious Game is used again. This second experience of SG allows for virtually live the learner a mission organization consultancy entrusted to him and to better understand that during the initiation phase, the activities performed to optimize the faulty process (in the case of INNOV8, the call center).

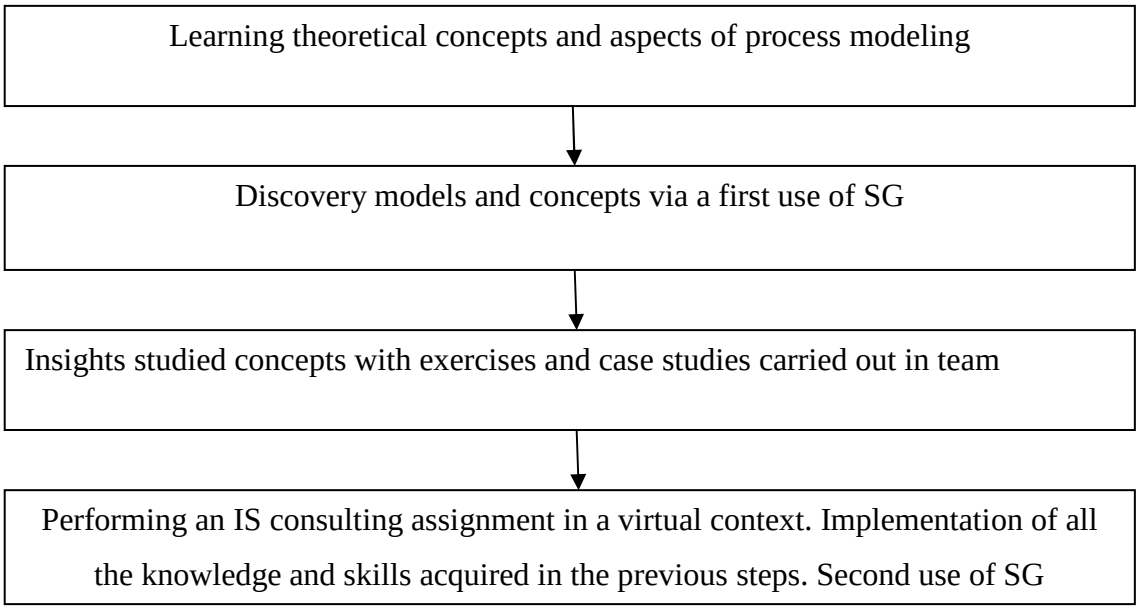

Figure 2: Design of an educational process that integrates the use of INNOV8

5. Conclusion

Companies are looking for professionalism and business knowledge for young graduates, in order to be operational more quickly. Furthermore the learners appreciate learning sessions that are close to professional situations.

The results of our experiments confirmed that it is useful to use SGs as a complementary learning material to theoretical. SGs allow learners to be active in their learning and to develop other skills through role playing close to their future carrier.

These observations could not be generalized to all communities of learners. Cultural characteristics, for example, probably have an impact on the key success factors of these devices. Scientific assessments we have today are in experimental stage. They are often made within a class or a small group of learners. As a future research direction, we plan to assess the SGs for educational purposes on a larger scale, in a regional or national.

Legal and Economic Aspects of E-Commerce in the Czech Republic

Martina Hedvicakova, Margareta Munsterova, University of Hradec Kralove, Faculty of Informatics and Management, Rokitanskeho 62, 500 03 Hradec Kralove III, Czech Republic,:
martina.hedvicakova@uhk.cz, margareta.munsterova@uhk.cz

Abstract

The number of persons utilizing internet and mobile shopping is increasing in global extent. Thus, for companies the internet is becoming a competitive advantage and a possibility to raise their income. The extent of fraudulent conduct rises hand in hand with the growing volume of e-commerce, and the legal conditions of e-commerce require precise definition. The first part of the present article is focused on the legal regulation of e-commerce in the Czech Republic. The following parts outline the situation in the European Union and actual application of e-commerce in the Czech Republic. The objective of the present article is to introduce the research in the area of legal regulation of e-commerce, especially focusing on legal requirements imposed on e-shop operators. Further on, the key terms of "consumer" and "operator" are outlined. A more detailed insight is dedicated to consumer's right to withdraw from a contract and operator's information duty.

Key words: e-commerce, law, legal regulation, trend, e-shop

1. Introduction

Electronic commerce can be called a phenomenon of nowadays that is tightly related to the development of information and telecommunication technology.

Since the early 1990s when the term 'electronic commerce' was first coined, the U.S. has significantly developed its e-commerce market and is undoubtedly a pioneer and a leader in e-commerce. (Zhang at all, 2016). Czech e-commerce is one of the most progressive in Europe.

The literature on ICT as an enabler of growth is vast, extending from aggregates (Jorgenson and Stiroh, 1999 and Chou et al., 2014) and investments in hardware to more disaggregated studies on selected groups of firms (Black and Lynch, 2001, Brynjolfsson and Hitt, 2003 and Bartelsman, 2010 and 2013; Van Reenen et al., 2010). ICT is considered a potential means of improving the quality of production factors. (Martin Falk, M., Hagsten, E., 2015)

Hand in hand with market globalization, commercial companies are mainly active in the area of e-commerce, unlike in the past when most transactions took place based on consumer contracts.

Also, a constantly rising amount of households are using internet-based commerce to satisfy their various needs. The emerging number of e-shops and thus the rising trust in this commercial platform also relates to the growing quality of e-shops, which is proportional to and depending on not only the technical aspects but specifically on the legislative framework.

The term "e-commerce" generally expresses enterprising by means of electronic technologies and includes commercial transactions between natural and legal persons, while such transactions are based on electronic data processing and transfer. An undisputable benefit of concluding such contracts is the fact that the need for contemporary presence at the same place and at the same time is eliminated. Logically, conclusion of contracts is accelerated and the related costs are decreasing.

2. Legal Regulation of E-Commerce

As far as the legal regulation on the so-called "European level" is regarded, especially important is Directive no. 2000/31/EC on certain legal aspects of information society services, in particular electronic commerce. Interestingly, the actual Directive does not define the term of "e-commerce". "Information society services" specified under Article 2 (a) of Transparency Directive no. 98/34/EC,

regulating information society services, include services typically provided against remuneration, remotely, by means of an electronic device for data processing and storage and upon individual request of the service recipient. Excluded from the Directive's scope of application are: sales of goods or provision of services off-line such as legal or medical consultancy, voice telephone services or direct marketing by telephone or fax, television and radio broadcasting etc. (1)

Another important regulation is Directive no. 1999/7/EC on the protection of consumers in respect of distance contracts that are regulated in the Czech Republic by the New Civil Code.

The New Civil Code regulates distance contracts under Sections 1,820 to 1,827 and 1,829 to1,840. In general, the legal regulation corresponds to the previous Civil Code, however, it is far more detailed.

From theoretic point of view, the area of electronic commerce represents a specific form of concluding contracts using technical means. However, the legal substance of such a contract remains the same as if the contract were concluded for instance in writing.

Two conditions must be met for an electronic legal act to be recognized as an act executed in written form. It must be obvious who is entering into it and its content must be explicit. These legal requirements are important in case of a dispute with regards to the evidence position of potential plaintiff. From the process perspective, there is an important refutable presumption of reliability of records on legal acts concluded in an electronic system provided that these records are executed systematically, in sequence and protected against changes.

(1) – see Article 1 (5) Directive 98/34/EC

As for distance contracts, the law requires entrepreneurs to meet their information duty. 1) This duty is anchored in Section 1,811 et seq., New Civil Code. Prior to concluding a contract, mostly before clicking a “Buy” icon, an entrepreneur must specify legally required information, i.e. his address, telephone number or contact information and specification of goods or service, price, method of payment and delivery, delivery costs and information on titles established by faulty performance, information on possible withdrawal from the contract etc.

By law, the information duty also includes Commercial Terms and Conditions and Complaint Regulations. Both documents constitute indispensable parts of internet commerce and every visitor of an e-shop must have free access to information included therein. Thus, the seller must meet his legal obligations applicable to the character of goods sold, services provided and business model operated. In addition, entrepreneurs running an activity subject to special regulation under special legal rules are obliged to comply with other specific requirements. As an example we can mention internet pharmacy providers or virtual mobile telecommunication network operators.

A key element of the regulation of distance contracts in the New Civil Code is consumer’s above-stated right to withdraw from the contract within 14 days following the conclusion and, in the event of a purchase agreement, following goods receipt (Section 1,829, Para 1, Letter a). Such withdrawal may take place without reason. At the same time, if the consumer has not been made aware of his right to withdraw from the contract, the consumer may withdraw from the contract within one year plus 14 days following contract conclusion, as stipulated by Section 1,829 Para 2, New Civil Code. However, if the consumer has been made aware of his right to withdraw from the contract within this period, the fourteen-day period for withdrawal commences on the day when the consumer received this information.

By withdrawing from the contract, the consumer becomes liable for sending or delivering the received goods back to the entrepreneur, doing so without undue delay but no later than 14 days following the withdrawal from the contract. At the same time, the entrepreneur is liable for returning all funds including delivery costs received based on the contract, back to the consumer, doing so within 14 days following the withdrawal.

However, in certain cases, the legislator logically limits the possibility of withdrawal, concretely under Section 1,837, New Civil Code. Most frequently, these are cases when the goods are custom

made, i.e. adapted to consumer's requirements or fitted to his person. The same applies to deliveries in enclosed packaging, unwrapped by the consumer, which cannot be repacked for hygienic reasons, goods subject to fast deterioration etc.

According to the provisions of Section 419, New Civil Code, every person concluding a contract or otherwise dealing with an entrepreneur, outside their own entrepreneurial activity or independent vocational activity, is considered a consumer.

An entrepreneur is considered every person carrying out an entrepreneurial activity on thein own account and responsibility by trading or by a similar manner, with the objective to do so constantly and in order to achieve profit (Section 420, New Civil Code).

Consumer contracts are considered all contracts with consumer acting on the one side and entrepreneur on the other side. This means in principle all contracts where consumer and entrepreneurs act as contracting parties; thus, a consumer contract may be for instance a purchase agreement, a lease agreement or even an innominate ("unnamed") agreement.

In the Czech Republic, there are almost 37 thousand e-shops active on the market. Unfortunately, not all of their operators have good knowledge of the legal regulations for internet entrepreneurship. Thus, entrepreneurs risk severe fines. This is certainly partially also caused by the New Civil Code that is generally considered a relatively complicated text, difficult to grasp even by lawyers, not talking about the lay public.

Entrepreneurs' unnecessary banal mistakes represent a relatively high risk. The situation is further complicated by the constantly changing development of legislature that requires permanent monitoring.

3. Current situation in the Czech Republic

In 2015, more than 3.1 million Czech households (73 percent) were furnished with a computer and internet access. For the first time in 2015, more individuals used the internet than the computer. *"As for the number of internet users in adult population, in 2014 the Czech Republic even outran the EU28 average. This was due to the fact that the internet was used by 79.7 percent of the Czech population between 16 and 74 years of age, while at the same time the EU average was 78.0 percent."*

Also, the number of people using the internet for shopping increases year by year. In the second quarter of 2015, almost 3.7 million inhabitants reported that they had effectuated a purchase transaction via internet in the precedent 12 months. "*The most lucrative target group in the long-term for e-shops are women on their maternity leave. Around 65 percent of them shop via internet. Only less than 14 percent of them reported that they had never shopped via internet,*" says Romana Malečková. The most frequently reported categories of goods purchased via internet are clothes, shoes and fashion accessories, tickets for sports and cultural events, cosmetics, electronic devices and air tickets. Czech Statistical Office (2015)

Czech shopping portal Heureka states that this year confirmed the long-term predictions indicating a consolidation of the number of e-shops on the Czech market. While in previous years the number of e-shops was rising, according to Heureka currently there are around 36,800 of them on the Czech market, which represents a decrease by 1 percent as compared to 2014.

"*Compared to other European countries, there are three times as many e-shops operating in the Czech market, so in this regard the market is already saturated. But it does not mean that the on-line market will no longer grow. There is still potential of e-commerce in the Czech Republic, the market forces will just regroup,*" said Tomáš Breverman in his comment on the situation. Channel World (2015)

The Electronic Commerce Association (APEK) and the shopping guide Heureka.cz state that the turnover of Czech e-commerce in 2015 rose significantly and achieved roughly CZK 81 billion (see tab. 1), increasing its proportion on Czech retail by one percentage point up to 8.1 percent. Czech

Statistical Office (2015)

Tab. 1. Estimated trend of Czech e-commerce from 2014 to 2016, Source: Channel World (2016)

	2014	**2015 (est.)**	**2016 (est.)*** **
E-commerce turnover	CZK 67 billion	CZK 81 billion*	CZK 95-100 billion
Interim growth	15.5 percent	21-26 percent**	20-25 percent

** estimate by APEK and Heureka.cz,** estimate of the percentage of growth depending on the source: data APEK/Heureka.cz a Acomware, *** estimate by Acomware*

If we focus on the composition of e-shops in the Czech Republic, then more than a half of the Czech turnover is covered by e-shops with household electronics, mobile phones and IT equipment. Also DIY and gardening, fashion and hobby products are becoming more and more popular. The overall interest in children's goods is rising. The fastest growing segment on Heureka are pharmacies.

4. Discussion and Conclusion

The first part of the present paper described the legislative conditions of e-commerce in the Czech Republic, showing a growing trend despite a slow-down as compared to previous years. According to first estimates for 2015, for the first time in the history, the number of e-shops will slightly decrease by approximately 1 percent. However, with respect to the total number of e-shops, the Czech Republic ranks among EU leading countries. The total e-commerce turnover figures are sharply rising and another increase is expected, although this may be due to economic development because the Czech economy is facing expansion.

Based on an analysis of the development of e-commerce in the Czech Republic and in the EU, authors are realizing a survey with the objective to identify differences in e-commerce in the various Czech regions and to address their compliance with legal aspects of e-commerce. Since the research mainly addresses the legal aspects of e-commerce in the Czech Republic, a major part of the questionnaire survey is focused on legal compliance of e-commerce.

The objective of the survey is to examine a sample of 50 websites focused on sales of electronic devices as these rank among the most sold goods on the internet. Companies will be selected for the survey by means of pre-defined goods entered into the web-based comparison portal Heureka, which ranks among the most popular search engines in the Czech Republic. The selected e-shops will be examined from legal point of view, focusing on e-shop operators' compliance with statutory requirements, i.e. compliance with and complexity of information duty, provision of personal data protection, information on possible goods return and/or withdrawal from purchase contract and publishing of claim handling rules and commercial terms and conditions.

Previous observation of the problem area of concern incites a number of questions to be examined, especially concerning the need for and actual realization of examination of potential failures by operators, legal consequences of such failures and subsequent sanctions related to the breach of mandatory legal provisions. Another question that could be examined is for instance possible arrangement of contractual penalty in e-commerce. According to the nowadays' legislation, contractual penalty cannot be stipulated by commercial terms and conditions but it may be arranged by telephone in the event that customer refuses to receive goods. In another part of the survey, authors will also address the evidence position of potential plaintiff concerning legal requirements of accepting evidence in the form of telephone call records.

Proposals to Improve the Satisfaction of Senior Citizens at the Municipality Level. Research Results

Martina Rašticová
Mendel University in Brno, Czech Republic
martina.rasticova@mendelu.cz
Simona Pohanková
Mendel University in Brno, Czech Republic
pohankova@seznam.cz

Abstract

The aim of the study is to identify what measures may lead to an improvement of the satisfaction of senior citizens at three levels: individual, corporate, and municipality. Part of the research is then concerned with the sources of information used by the senior citizens in the places of their residence. These results indicate that it is the quality of services offered to senior citizens in the place of their residence that affects considerably the satisfaction of elderly people. Thus, the municipalities may employ relatively easy procedures to help improve the senior citizens' quality of and satisfaction with life, provided that they concentrate on their real needs. Important and positive finding is that senior citizens, too, are interested in work on the improvement of the quality of their standard of living. Volunteering with the involvement of the senior citizens offers an opportunity for the municipalities with emphasis on a better access to information. Lucky are those who know the benefits of old age when they are young as well as those who can keep the blessings of youth when they grow old. (Johann Wolfgang von Goethe). Well, a happy old age no doubt includes a proactive, positive approach to life and care for other people that may be equally or even more in need as the present research has also shown.

Keywords: Demographic ageing of society, Age management, Satisfaction of seniors, Active ageing, Municipality level

Introduction

The present study aims to identify what measures may lead to an *improvement of the satisfaction of senior citizens at three levels:* individual, corporate, and municipality. Intentionally, two South Moravian municipalities have been chosen to compare the requirements, expectations, and needs of the senior citizens living in Brno, a city with a population of several hundreds of thousands, with those of the elderly people living in a small town of Vyškov. The study brings the first results of an enquiry among senior citizens asking them to suggest improvements of their lives at three levels. The second part of the research is then concerned with the sources of information used by the senior citizens in the places of their residence. These results indicate that it is the quality of services offered to senior citizens in the place of their residence that affects considerably the satisfaction of elderly people. However, of interest were also the reflections of senior citizens on the perception of their own contributions and activities that could help increase their satisfaction with life.

The first part of the study summarises the ageing forms and the changes accompanying elderly people, and formulates a concept of satisfactory and active ageing while the second part presents the initial results of a research focusing on suggestions by senior citizens that would lead to an improvement in the satisfaction of elderly people and to identifying the sources of information for senior citizens.

Ageing

According to Jaro Křivohlavý (2002), the span of human lifetime can be divided into three periods. The age of an infant and that of an adult with the last period being that of aging. Aging may be viewed from different angles. Jaro Křivohlavý (2011), for one, regards ageing as the third stage of life in which an individual's personality and culture becomes fully mature and developed able to pass

on the cultural heritage. He also compares ageing to a water flow beginning as a small stream and eventually reaching the sea.

A different point of view is that of Jana Mlýnková (2011), who says that ageing is a process characterised by degenerative changes taking place in the cells. The science concerned with ageing is called gerontology, which is thought of as born with the publishing of Senescence, the Last Half of Life by G. Stanley Hall.

Rostislav Čevela (2012) speaks of three forms of ageing:
Successful ageing and healthful (active) ageing – the physical and mental health condition is up to the requirements of a given situation, which ensures satisfaction, self-fulfilment, and participation long into advanced age. Important here are the activities offered and the provision of space for self-fulfilment including employment.

Normal ageing and old age – during this type of ageing, one can observe imbalance between the health and functional conditions. Imbalance also appears between the psychic needs and the requirements of the environment or the social and economic opportunities. This results in insufficient satisfaction, self-fulfilment, or participation.

Pathologic ageing – the health and functional conditions, adaptation, satisfaction and self-fulfilment are much worse than those of a majority of their peers in the same situation. Diseases, functional deterioration, are considerably more frequent or appearing sooner, often accompanied by resignation. In cases of pathologic ageing, poverty may also play a significant role. Such condition is also much aggravated by more serious major diseases such as Alzheimer's disease and cancer. Negative impacts may also come from the immediate neighbourhood triggered by tragic events such as losing a partner. The problems of pathologic ageing may be intensified by worse ability to communicate with the neighbourhood or to make new social contacts. Lacking may also be the support or helpfulness of the closest persons. Pathologic ageing is also mentioned by Eva Malíková (2011), who says that it is manifested by degraded self-sufficiency.

Old age is accompanied by a number of changes. Venglářová (2007) describes these at three levels: physical, psychical, a social (tab. 1).

Tab. 1: Ageing conditioned changes

PHYSICAL CHANGES	PSYCHICAL CHANGES	SOCIAL CHANGES
➢ muscle mass reduction	➢ memory deterioration	➢ retirement
➢ changes in thermoregulation	➢ difficult acquiring of new knowledge	➢ change of lifestyle
➢ changes in sensory activity	➢ incredulity	➢ moving
➢ degenerative sensory changes	➢ lower self-confidence	➢ loss of near persons
➢ cardiopulmonary changes	➢ suggestibility	➢ loneliness
➢ changes in the digestive system (digestion, defecation)	➢ emotional instability	➢ financial difficulties
➢ changes in urinating	➢ changes in perception	
➢ changes in sexual activity	➢ deterioration of judgement	

Source: Venglářová (2007, p. 12)

The above changes may lead to many young people assuming a negative attitude towards ageing and, by transferring this attitude to old people, causing them to perceive themselves and their old age negatively (Rašticová, Kolářová, 2015). Some people also keep viewing ageing negatively for the whole lifetime until their own old age. Positive psychology is an approach that tries to see each stage in life including old age in a positive framework. According to Křivohlavý (2011), one of the objectives of positive psychology should be to help people avoid the situations that could negatively influence the quality of their lives, in other words, to help them subjectively experience well-being.

Satisfactory ageing

Outstanding psychologist Vaillant (2002), asked himself: *What helps people experience happiness in old age?* Based on the results of his research, he formulated seven major factors thanks to which senior citizens may feel happier and which are necessary for satisfactory ageing:

- ability to adapt to changing conditions
- education
- faithful partner
- non-smoking
- moderate consumption of alcohol
- sufficient physical exercise
- reasonable weight

Using the above seven factors, he then divided elderly people into four groups. The first group is formed by *the happy and healthy*, the second by the *sad and ill*, the third one by *the prematurely dead*, while the fourth group is a melange of well-being and sorrow, health, pain, satisfaction, and resignation. Slezáčková (2013) says that, if one wishes to belong to the happy and healthy group, one cannot rely on his or her genetic predisposition, but has to do something for it adding that, in the old age, we are actually getting back what we have experienced before.

The length of employment in ageing people is also discussed. There are two different points of view to this problematic. One is the senior´s perspective, the other one is the macroeconomic point of view. If the Czech Republic's economy is to be growing, and the pension system stable, the potential of older employees will have to be used, too. This will necessitate changes in the way the employers view their elderly employees and their professional capacity (Rašticová et al., 2013, see also Putnová, 2014). Daniela Spirkova and Beate Stehlikova (2015) pointed out that creation of condition for sustainable development in the European areas puts increased demands also on industry innovation, research and education. As proved by Spirkova et al. (2015) the crucial factor for an enterprise to be successful is social capital and social innovation.

Another recent concept employed to investigate the satisfaction of senior citizens is *active ageing*. According to Dagmar Dvořáčková (2012), this is a term adopted by the World Health Organization in late 1990's. This is a concept used in a sense broader that just healthy ageing being based on the principles of the UN organization for senior citizens, which can succinctly be characterized as: independence, self-fulfilment, participation in society, dignity, and care. Active ageing also involves respecting the rights of elderly people and their participation in public elections. By this concept, senior citizens form a highly diversified group. It is, therefore, very important that they should be provided with what is called an *enabling environment*, that is, environment in which elderly people can lead a better life as it is adapted to better suit their needs. In this connection, the World Health Organisation speaks about: *barrier-free zones, flexible working hours, part-time jobs, and security* both at work and in public spaces. Society should be prepared to accept that senior citizens need much more time than other people to come to terms with some things. Auxiliary measures and services should also be available to improve the mobility of elderly people. The idea of active ageing should be the future solution for senior citizens with an aim to preserve self-sufficiency and independence. The quality of life of an individual depends on his or her conduct while being young, which may, for example, affect the family life (see also Mikušová, Rašticová, 2015).

At present, active ageing is a major issue in the academic world, too. The quality of active ageing can be measured by an index of active ageing consisting of twenty items divided into four categories (Štěpánková, 2014). Educational activities gain the upper hand being offered to senior citizens in an increasing measure. The most favourite is the concept of the *University of the Third Age* (U3A) or academy of the third age. In both cities (Brno and Vyškov), a wide range of U3A or other such programmes are offered.

The method

To achieve the research goal, questionnaire enquiry was used. Data were collected in autumn 2015 in two localities of the southeast part of the Czech Republic, the city of Brno and the town of Vyškov. From 121 respondents addressed at random in seniors' clubs and libraries 111 filled-in questionnaires were received.

The research sample consisted of 111 senior citizens including 32% men and 68% women, the average respondent age being 67.7 years, about one half (59%) of the respondents living in Brno and one half of them (41%) in Vyškov.

Research Results

To find out what can be done to *improve the satisfaction of elderly people at different levels*, the respondents were asked, based on their own previous experience, to freely associate and fill in answers to several levels:

- at the individual level, that is, as viewed by the respondent
- at the corporate level
- at the municipality level

Tab. 2: Suggestions to improve the satisfaction of elderly people at three levels

INDIVIDUAL	CORPORATE	MUNICIPALITY
Helping others, volunteering (38)	Reunions of former colleagues (34)	Increase in pensions (28)
More activities by senior citizens themselves (22)	Equal opportunities across generations of employees (20)	Access to information (25)
Consideration for others (8)	Contributions to health treatment (13)	Free transport (20)
Spending more time on others and proactive activities (6)	Convalescent stays (11)	More events for senior citizens (17)
Active listening to those in need (6)	Products (services) of companies should be: - of good quality (11) - available in v regions (8) - affordable (7)	Barrier free access and availability of shops (16)
		Care for senior citizens (13)
		City and town cleaning (12)
		Safety in city and town (11)
		Low-rise trams (7)
		More retirement homes (5)

Source: author's own research

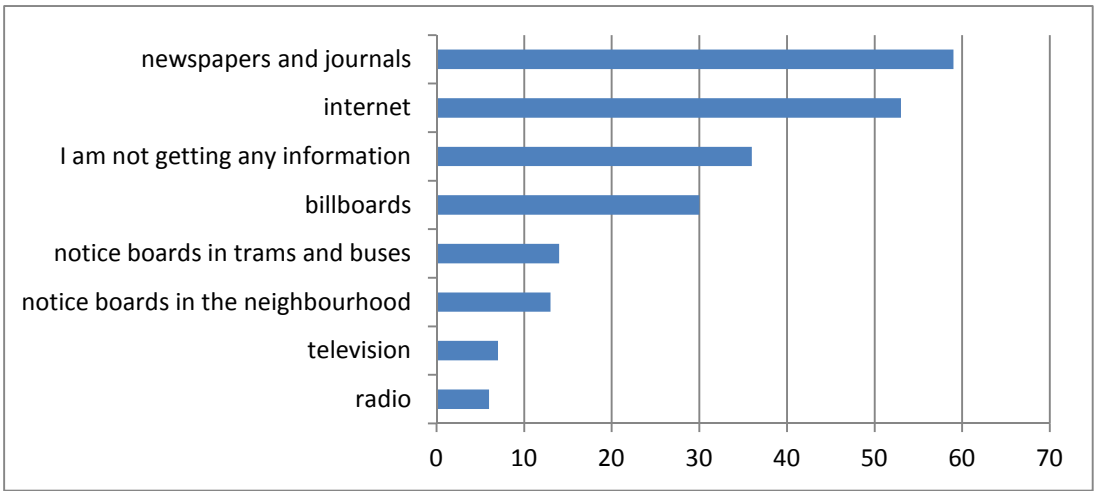
The results imply that the most suggestions for improving the standard of life and satisfaction from the respondents were addressed to the municipalities. Although increase in pension seems to be the most frequent wish among the pensioners, it cannot be fulfilled at the municipality level. As an inspiration to the municipality on the other hand, may serve the requirement of a better access to information mentioned by the respondents twenty-five times or the wish for more events organized for elderly people and barrier-free access. Judging by the list of wishes and needs of the respondents, these are the active ones showing interest in public affairs and wishing to stay in contact with their city or town.

Asked about the needs that might be met by companies and enterprises, the respondents most often mentioned reunions of former employees and colleagues, which also reflects the structure of the sample consisting of senior citizens no longer employed and thus lacking contact with their former

colleagues, which can only be made at reunions. Other wishes that might be met by companies such as contributions to health treatment and convalescent stays seem to involve still employed rather than retired senior citizens. Remarkable is the frequent demand for equal opportunities, which could signify motivation to stay employed even longer provided that equal conditions were set across generations. However, verifying this hypothesis would require further detailed enquiries using interviews or focus groups. Often, the respondents voiced their requirements concerning the quality and availability of products, which again confirms that the respondents view the companies as customers rather than former employees.

Very inspiring for all the parties involved are then the respondents' statements reflecting what could be made better for elderly people at the individual level, in other words, what they themselves could do to improve the quality of their own lives. Most of the respondents mentioned volunteering and helping the others, active listening to and consideration for the others as activities by which the senior citizen themselves could improve the quality of life.

As part of the enquiry, also information sources were studied used most frequently by senior citizens. In some aspects, the results were surprising (see Graph 1).



Source: author's own research

Graph 1: Most frequent information sources used by senior citizens

According to the results of the investigation, the most frequent information channel is still newspapers, mentioned almost sixty times. As positive can be seen the fact that about as frequently the senior citizens (aged 67 on average) find information on the fastest channel, that is, the Internet. However, a large percentage of respondents also admitted having no information source. Surprising is also that the respondents do not regard television and the radio as the main information channel.

Summary

The active ageing issues are dynamic, changing along with the changing senior generation, legislation, economic situation of the country and the particular region. As senior citizens form the most heterogeneous population group, it is difficult if not impossible to formulate clearly the needs applying to all of them. Neither was this the ambition of this research. In it, we focused on identifying the needs of a clearly defined group of senior citizens depending on the setting of different measures in two selected municipalities – the city of Brno and the town of Vyškov. Although, for reasons stated above, the results cannot be generalized, we are convinced that the basic needs and wishes formulated by the senior citizens investigated apply across the entire group of senior citizens from different countries. These needs include: helping others, volunteering, reunions with former colleagues, and access to information. Contacts and relations with other people are areas most reduced after retirement. A number of researches (cit.) have also confirmed that it is loneliness rather than financial or health issues that elderly people suffer most from. The need for access to

information is typical of all active beings that seek active or at least passive involvement in what is going on about them.

Thus, the municipalities may employ relatively easy procedures to help improve the senior citizens' quality of and satisfaction with life, provided that they concentrate on their real needs. Important and positive finding is that senior citizens, too, are interested in work on the improvement of the quality of their standard of living. Volunteering with the involvement of the senior citizens offers an opportunity for the municipalities with emphasis on a better access to information.

Lucky are those who know the benefits of old age when they are young as well as those who can keep the blessings of youth when they grow old. (Johann Wolfgang von Goethe). Well, a happy old age no doubt includes a proactive, positive approach to life and care for other people that may be equally or even more in need as the present research has also shown.

Résumé

Cette étude examine comment le Bouche à Oreille électronique - positif ou négatif- peut influencer l'état émotionnel, l'attitude et l'intention d'achat du récepteur. Nous avons mené une recherche exploratoire documentaire qui nous a permis de mieux expliquer le comportement du consommateur en ligne. La revue de la littérature en marketing, nous a permis d'établir un cadre conceptuel mettant en relief la relation entre le BAO électronique et les variables comportementales à savoir l'état émotionnel, l'attitude et l'intention d'achat des consommateurs en ligne.

Mots clés : Bouche à Oreille électronique ; émotions ; attitude ; intention d'achat.

Abstract:

This study examines how receiving negative and positive word-of-mouth from satisfied and dissatisfied customers influences the potential customer behavior. This work aims to study the relationship between the Word Of Mouth (WOM) received through social networks and behavioral variables such as emotions, attitude and the receiver's purchase intention. We have conducted an exploratory research. This study allows explaining customer behavior online. After a marketing literature, we have established our conceptual model and hypotheses studying the relationship between the different variables.

Key words: E-WOM; emotions; attitude; purchase intention.

Introduction :

Les études menées sur la communication en ligne sont nombreuses (Iacobucci, 2007, Mayzlin et Godes, 2004 ; O'Connor, 2008…). Les réseaux ne sont pas nouveaux en marketing et la communication interpersonnelle revêt une importance de plus en plus évidente. Cependant, plusieurs études ont mis l'accent sur le concept du Bouche à Oreille et les manifestations de sa diffusion. Avec l'arrivée de l'Internet et plus récemment les réseaux sociaux (Facebook, Twitter, instgram…), on parle désormais de la puissance, l'étendue ainsi que l'intensité et la rapidité du Bouche à Oreille (BAO).

Notre recherche s'attèle à répondre à une question essentielle : Dans quelle mesure la réception du BAO à travers les réseaux sociaux influence-t-elle les émotions, l'attitude ainsi que l'intention d'achat du récepteur ? Ce travail présente un intérêt théorique à savoir la mise en évidence, sur un plan conceptuel, de l'impact potentiel que peut causer la transmission du BAO à travers les réseaux sociaux sur l'état émotionnel de l'internaute-consommateur, son attitude et son intention d'achat. En effet, nous considérons que ce genre de relations n'a pas été suffisamment investigué dans la littérature et plus particulièrement l'impact du BAO électronique sur l'état émotionnel de l'internaute.

Après avoir éclairci le cadre théorique de notre recherche, nous proposons un cadre conceptuel. Certaines pistes de recherches sont finalement proposées.

1. Cadre Théorique de la Recherche

1.1 Le Bouche à Oreille (BAO) et le Bouche à Oreille électronique (e WOM)

Le bouche à oreille (BAO) est un phénomène qui ne date pas d'aujourd'hui. C'est un outil marketing de plus en plus utilisé par les entreprises dans la remontée des informations (Kaltz et al 1955). Il représente aussi un moyen efficace d'obtenir une évaluation des services et des informations utiles à partir d'autres clients expérimentés dans un délai assez court (Mazzarol, et al, 2007). D'autres auteurs définissent le BAO comme une forme de communication informelle qui peut avoir un impact positif ou négatif sur les caractéristiques d'un produit ou d'un service (Helm, 2000).

Le BAO permet aux consommateurs de partager des informations et de faire des évaluations qui guident d'autres acheteurs directs dans leur choix de produits ou de services (Litvin et al. 2008). Par ailleurs, le BAO positif augmente la probabilité d'achat ; tandis que le BAO négatif crée plutôt l'effet contraire (Setiawan, 2014). Cet outil apparait comme étant le résultat d'expériences de consommation vécues par un individu avec un produit (Mayzlin et Godes, 2004).

Les consommateurs fondent leurs décisions sur les commentaires fournis par les expériences d'achat ou de consommation rapportées par leur entourage (Luo et Zhong, 2015). Aujourd'hui, un client mécontent peut partager son expérience négative avec une douzaine de consommateurs dans son entourage direct, et il peut influencer des milliers de pairs au sein des réseaux sociaux tels que Facebook, Twitter, et Myspace (O'Connor, 2008). Le BAO électronique (e WOM) est considéré comme un support fiable et une source d'information impartiale. Il est soutenu que le BAO électronique influence les attentes des consommateurs, leurs préférences et leurs attitudes, et affecte leurs décisions d'achat (Litvin et al. 2008; Luo et Zhong, 2015). Le BAO électronique peut se propager via des plateformes d'opinion, des forums de discussion, il se manifeste à travers le boycott des sites Web ou des sites permettant la communication entre consommateurs (Hennig-Thurau et al. 2004). Il implique la participation des acteurs dont le comportement est motivé par diverses raisons, en particulier le désir d'interactions sociales et le maintien des liens sociaux, la jouissance des activités en ligne, le soutien affectif, l'altruisme, l'identification, le sentiment de la solidarité, l'entraide ou l'estime de soi (Hennig-Thurau et al. 2004; Munar et Jacobsen, 2014).

Le BAO électronique diffère du BAO traditionnel principalement par sa commodité, sa portée et sa vitesse d'interaction (Luo et Zhong, 2015; Serra Cantallops et Salvi, 2014). Contrairement au BAO traditionnel, qui traduit habituellement les préoccupations et les opinions exprimées par des connaissances (par exemple, les amis, les collègues, et la famille), le BAO électronique est souvent traduit par des commentaires en ligne qui sont générés par des sources inconnues (Xie et al. 2011). Cependant, les réseaux comme Facebook, Twitter, Instagram… sont souvent formés par les amis, la famille, ce qui donne une certaine crédibilité aux commentaires par rapport au contenu. Ainsi, le réseau social Facebook, par exemple, élargit les cercles sociaux des consommateurs et augmente la fréquence, et la durée de contact interpersonnel (Luo et Zhong, 2015). Luo et Zhong (2015) soulignent le rôle des relations et des interactions sociales à travers le Bouche à Oreille Electronique sur le réseau social. Le BAO électronique influence les attitudes et la décision des consommateurs en ligne établissant, ainsi, des liens sociaux forts (Luo et Zhong, 2015). Cette forme de communication donne un aperçu sur la façon dont les consommateurs utilisent l'information en ligne pour aider une personne à la prise de décision d'un achat par l'utilisation de notes en ligne (Sparks et Browning, 2011), des médias sociaux (Brown et al. 2007), des agents de recommandation en ligne (Gershoff et al. 2003), et des forums en ligne (Harrison-Walker, 2001).

Beaucoup d'études antérieures ont traité la relation classique entre le BAO traditionnel et les émotions, l'attitude et l'intention d'achat. Nous cherchons a travers notre étude à nous focaliser sur le lien existant entre ces variables, mais, dans e contexte des réseaux sociaux et plus particulièrement, nous chercherons à explorer comment le consommateur se comporte face à la réception d'un BAO autour d'un produit sur les réseaux sociaux.

1.2 Le BAO a un potentiel émotionnel :

Laurence Graillot (1998) stipule que les émotions peuvent diriger le processus de prise de décision de l'individu et influencer ses réactions comportementales. Ainsi, selon l'auteur, une même émotion peut avoir des effets différents sur plusieurs personnes et même sur la même personne dans différentes situations. Les émotions peuvent exercer une influence sur la contraction des muscles du visage, sur le corps de l'individu, sur les systèmes de la circulation sanguine et respiratoire, sur l'activité électrique du cerveau. Traditionnellement, les émotions sont observées comme étant des états particuliers de la conscience. En effet, les individus qui vivent des émotions assez intenses réalisent que leur expérience vécue ne correspond pas à un état ordinaire de la conscience (Izard, 1977).

Westbrook et Olivier (1991) soulignent que « *l'émotion fait référence à l'ensemble des réponses émotionnelles provoquées pendant l'usage d'un produit ou des expériences de consommation et lors de l'achat* ». La transmission du BAO par l'émetteur a des antécédents émotionnels car une émotion positive ou négative peut contribuer à la transmission du BAO (Sweeney et Soutar, 2001). On peut affirmer, dès lors, que l'acte de la transmission du BAO réveille les souvenirs émotionnels de l'émetteur et ramène les émotions ressenties au moment de l'expérience originale (Soderlûnd et Rosergren, 2007).

1.3 Le récepteur du BAO électronique et son évaluation de l'émetteur

La transmission du BAO fournit au récepteur des informations sur l'état émotionnel de l'émetteur. Par exemple, des informations concernant une expérience négative sont susceptibles de laisser croire que l'émetteur se sent mal. Lorsqu'il parle de son expérience, l'émetteur transmet des signaux supplémentaires tels que les expressions faciales, les gestes, le ton de la voix qui peuvent informer sur son état émotionnel (Soderlûnd, 2006). Le récepteur utilise ces signaux pour évaluer l'état émotionnel de l'émetteur (Soderlûnd et Rosergren, 2007). Cette évaluation sert à équilibrer la relation entre l'individu et son environnement en identifiant dans quelle mesure l'émetteur se sent bien ou mal. Les individus sont très habiles pour traiter des informations exprimées par le visage (Soderlûnd et Rosergren, 2007).

En ligne, on ne parle plus d'expressions faciales, de gestes, du ton de la voix, on parle désormais d'émoticons –Smiley- qui représentent des mimiques faciales comme des sourires, des clins d'œil, des moues de colères ou de tristesse ; ces émoticons (figure1) sont souvent utilisées dans les discussions en ligne et les réseaux sociaux (Marcoccia, 2000).

On trouve aussi, dans les forums en ligne, des ponctuations expressives comme par exemple -doubler le point d'exclamation ou le point d'interrogation- (Luzzatti et al, 2002; Anis, 2000). Les émotions en ligne peuvent aussi se traduire par le langage figuratif et l'utilisation de métaphores permettant d'adjoindre une dimension émotionnelle aux écrits numériques (Delfino & Manca, 2007). Les études empiriques ont montré que l'évaluation de l'observateur de l'état émotionnel d'une personne est corrélée avec l'état émotionnel de la personne qui affiche ces émotions (Harker et Keltner, 2001 ; Neumann et Strack, 2000).

2. Le Cadre Conceptuel de la Recherche

2.1 Evaluation de l'état émotionnel en ligne

Les individus ont tendance à partager des histoires, des nouvelles et des opinions car celles-ci contiennent des informations utiles (Berger et Milkman, 2012). Par exemple, les internautes cherchent à partager leurs expériences vécues dans des restaurants ou encore la somme qui a été payée pour un produit ou un service. Ce comportement permet à d'autres individus d'économiser de l'argent ou de trouver un bon plan pour manger mieux. Par ailleurs, le fait de partager un contenu utile peut permettre d'aider les autres à être mieux informés pour améliorer leurs connaissances (Wojnicki et Godes 2008), à instaurer une valeur d'échange social (Homans 1958) ou encore, à générer la réciprocité (Fehr, Kirchsteiger et Riedl 1998).

Les aspects émotionnels de contenu peuvent également affecter la personne avec qui le contenu est partagé (Heath, Bell et Sternberg, 2001). Les individus discutent beaucoup de leurs expériences émotionnelles avec les autres, et les clients véhiculent d'avantage de BAO en cas de satisfaction ou d'insatisfaction (Anderson et Eugene 1998). Les gens peuvent aussi partager un contenu émotionnellement chargé afin de donner un sens à leurs expériences, de réduire la dissonance, ou d'approfondir les liens sociaux (Peters et Kashima 2007;. Rime et al 1991).

Toutefois, les auteurs affirment que l'émotion est contagieuse surtout quand il s'agit de situations sociales dans le sens où un individu est facilement influencé par l'émotion de la personne avec qui il interagit (Neumann et Strack, 2000). Certains auteurs mettent en évidence aussi le lien entre le comportement affiché par l'émetteur et les émotions ressenties par le récepteur à travers les mimiques faciales du visage de l'émetteur, les phrases et les mots utilisés ou même la ponctuation. Tous ces réactions peuvent traduire un certain état émotionnel (Hess et al, 1998). En fait, Ces mimiques faciales sont représentées graphiquement en ligne et permettent au récepteur d'évaluer l'état émotionnel de l'émetteur (Derks et al, 2007; Marcoccia, 2000).

Certains auteurs trouvent également que cette vision reposant sur un jugement automatique (automaticity-based view) de l'activité musculaire ou des mimiques faciales laisse peu de place à l'activité cognitive du récepteur. C'est pour cette raison, qu'on admet que les émotions du récepteur sont aussi fondées sur l'activité cognitive de l'évaluation qu'il fait de l'état émotionnel de la personne stimuli. Ainsi, et comme le confirment Hsee et al. (1990), notre prise de conscience, qu'une personne se trouve dans un état émotionnel particulier, pourrait finir par nous mettre dans le même état émotionnel (une sorte d'effet de contagion). Les auteurs mettent, donc, en évidence la relation causale qui existerait entre l'évaluation du récepteur de l'état émotionnel de l'émetteur et ses propres émotions ; le lien entre le stimulus et la réaction émotionnelle est ainsi médiatisé par l'évaluation (Soderlûnd et Rosergren, 2007). Nous posons donc l'hypothèse suivante :

H_1 : L'évaluation du récepteur de l'état émotionnel de l'émetteur à travers les réseaux sociaux a un impact sur ses émotions.

2.2 *Emotion et Attitude du récepteur en ligne*

Quand un objet particulier évoque certaines émotions, il est clair que ces émotions peuvent induire un certain jugement (Pham, 2004). Cet impact que peuvent causer les émotions sur les jugements fait référence à la notion d'« Affect infusion ». Deux mécanismes sont issus de cet état : l'affect-information se rapportant à l'état émotionnel par rapport à cet objet et l'« l Affect-priming » supportant que les émotions ont une influence directe sur les jugements (Forgas et George, 2001). Les émotions suggérées par le produit influencent l'attitude envers celui-ci (Brown et al, 1998). Certaines recherches montrent que les émotions ont un impact direct sur l'attitude. Cet impact a été aussi confirmé dans de nombreuses études portant sur la communication. Par exemple, les émotions créées par une personne influencent l'évaluation de la marque ou l'objet annoncé (Soderlûnd et Rosergren, 2007). Plus encore, les recherches ont montré aussi une forte relation entre l'attitude du récepteur à travers un BAO électronique et les émotions ressenties par ce dernier. D'après ces résultats et suivant la logique d'« affect infusion » mentionnée précédemment, nous pouvons avancer l'hypothèse suivante :

H_2 : Les émotions ressenties par le récepteur membre du réseau social ont un impact sur son attitude envers le produit objet du BAO.

2.3 *Attitude et intention d'achat du récepteur en ligne*

L'attitude du consommateur n'est pas directement corrélée avec son comportement mais plutôt avec son intention (Soderlund et Rosengren, 2007). Les attitudes et les autres évaluations, comme la satisfaction du client, affectent les intentions d'achat et l'intention de ré-achat (Lucas, 2003). Les

travaux empiriques confirment que l'attitude du récepteur envers une entreprise qui fait l'objet du BAO est positivement associée avec son intention d'achat.

Dans la littérature sur le BAO électronique, l'intention d'achat est la variable la plus souvent étudiée. Les attitudes des clients envers les produits résultent des commentaires en ligne des internautes (Bateineh, 2015). Généralement, les recommandations des clients sont positivement associées avec les intentions d'achat, et peuvent affecter leurs choix (Chang & Chin, 2010). Les critiques et les commentaires des clients sont, dès lors, extrêmement importants pour les commerçants en ligne. La qualité et la quantité de ces informations en ligne influencent positivement les intentions d'achat du client (Do-Hyung et al. 2007). D'où nous pouvons postuler l'hypothèse suivante :

H_3 : L'attitude du récepteur envers le produit qui fait l'objet du BAO a un impact sur son intention d'achat de ce produit.

La figure 1 présente le cadre conceptuel issu des relations entre les variables que nous avons présentées :

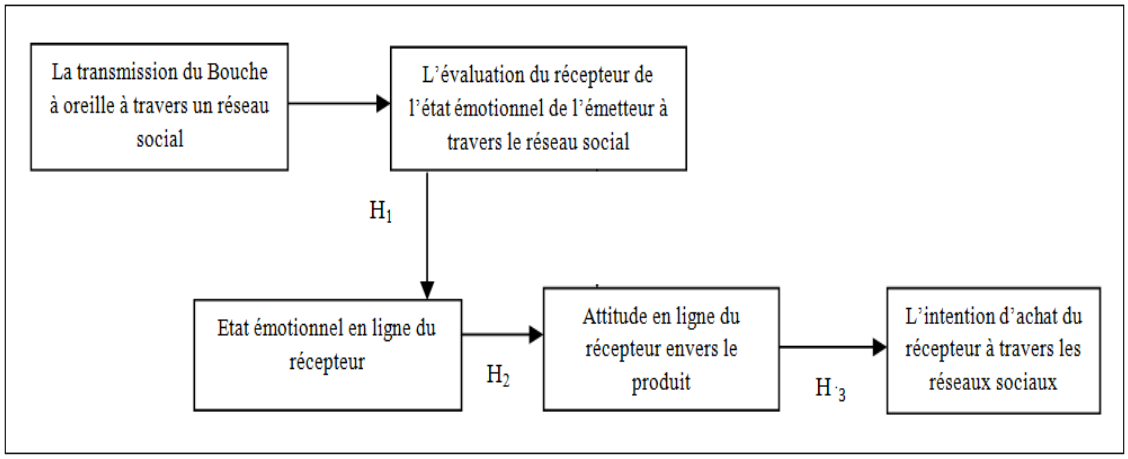

Figure 1 : Modèle conceptuel de la recherche

3 Conclusion et Recommandations :

Dans le cadre de cette recherche, nous avons exploré l'impact du BAO à travers les réseaux sociaux sur les émotions, l'attitude et l'intention d'achat du consommateur en ligne. Une étude documentaire a permis de proposer un cadre conceptuel permettant de mieux cerner la relation causale entre le BAO électronique et le comportement du consommateur.

Nombreux sont les auteurs à avoir démontré l'efficacité du BAO comme une source de communication et de partage d'informations sur un produit, un service ou une marque. Cette efficacité peut se mesurer par l'influence du BAO sur l'opinion et la représentation qu'un consommateur peut se faire d'un produit.

Malgré l'importance de plus en plus grande des achats en ligne qui se manifeste à travers l'apparition des nouveaux sites (i-e les deals), nous pouvons déplorer l'absence d'études académiques sur l'impact de la communication en ligne sur le comportement du consommateur.

En guise de conclusion, certaines pistes de recherche peuvent paraitre particulièrement prometteuses.

Il serait ainsi intéressant de mener une nétnographie afin d'observer l'état émotionnel du consommateur à travers les réseaux sociaux.

Une recherche quantitative permettra certainement de tester la validité du modèle proposé.

Inflation under the Influence of Deflation Pressures

Martina Hedvicakova, Libuse Svobodova, University of Hradec Kralove, Faculty of Informatics and Management, Rokitanskeho 62, 500 03 Hradec Kralove III, Czech Republic,
martina.hedvicakova@uhk.cz, libuse.svobodova@uhk.cz

Abstract

This article provides a Czech and European overview of the inflation versus deflation debate which has captured the attention of the economics profession in the years following the US housing bubble. Euro area annual inflation was -0.2 % in February 2016, down from 0.3 % in January 2016. A year earlier, the rate was -0.3 %. Deflation can be, under certain conditions, for the real economy significantly greater threat than classic inflation as we know it. There is therefore not deflation as deflation. A mere drop in prices is not yet a problem. Problems occur in a situation where there is a decline in prices caused by a decrease in the volume of money in the economy, a credit contraction and similar phenomena. A similar situation is always connected with the economic recession and all negative phenomena that accompany it. The development of inflation in the Czech Republic and in the European Union will depend on the further economic development of important macroeconomic indicators (mainly GDP). The goal of this paper is evaluation of the current economic situation in the Czech Republic and in the EU with regard to the inflation.

Key words: inflation, deflation, European Union, consumer price indices

1. Introduction

During the post-crisis period, economic performance has been highly heterogenous across the euro area. While some economies rebounded quickly after the 2009 output collapse, others are undergoing a protracted further decline as part of an extensive deleveraging process. At the same time, inflation has been subdued throughout the whole of the euro area and intra-euro-area exchange rates have hardly moved. (Kushinov et all, 2016)

Inflation targeting has attracted attention to researchers and policy makers since the first attempt in New Zealand in 1990.

For high-income or developed countries, the significant motive of monetary authority to choose inflation targeting is the desire to keep or enhance anti-inflation credibility, and inflation targeting could be a natural option under more floats with the absence of nominal exchange rate anchor. On the other hand, low-income or developing countries with the large size of public debts are not likely to choose inflation targeting, so that fiscal fragility would discourage monetary authority to adopt restrictive monetary policy under inflation targeting. (Ismailov at all, 2016)

Well-anchored inflation expectations have become a key indicator for the credibility of a central bank’s inflation target. Since the outbreak of the financial crisis, the (de-)anchoring of long-term U.S. inflation expectations has been under debate. (Strohsal, et all, 2016)

According to Selgin (1997, p. 14) Zero inflationist' neglect of the alternative of secular deflation, along with their failure to consider the implications of productivity changes, has led them to embrace a faulty monetary policy ideal. In model economies where productivity does not change, it is relatively easy to make the case that zero inflation (that is, a constant price level) is consistent with keeping real economic activity on or close to its efficient and 'natural' path. But in reality productivity is constancy changing, generally for the better. In the real world, a lithe secular deflation, along with upward movements in the price level mirroring adverse supply shocks, would be better than zero inflation.

The goal of this paper is evaluation of the current economic situation in the Czech Republic and in the EU with regard to the inflation.

2. Measuring Inflation

In general, inflation is the growth of price level over a certain period of time. As a statistical concept, inflation is based, etc.) and services (in the areas of repair, housing, household on measuring net changes in prices using consumer price indices (CPI). Price indices measure the price level of a selected basket containing representative products and services (about 710 items) in two compared periods. The weights of individual price representatives in the consumer basket correspond to the share of a given kind of consumption which they represent in total household consumption. The consumer basket comprises foodstuffs (food, beverages and tobacco), other goods (clothing, furniture, household utensils, miscellaneous chemist's and small articles, goods for transport and leisure, personal care goodsrunning, health and social care, transport, leisure, education, catering and accommodation, personal care and financial services).

Inflation rate is a percentage increase in consumer price indices (CPI). (Czech statistical Office, 2016)

3. Actual situation in Czech Republic

Consumer prices in Czech Republic increased 0.5 percent year-on-year in February 2016, following a 0.6 growth in January and in line with market expectations. Upward pressure came from: alcoholic beverages and tobacco (+0.3 percent), housing and utilities (+0.2 percent) and recreation and culture (+0.2 percent). In contrast, prices went down for food and non-alcoholic beverages (-0.2 percent) and transport (-0.2 percent). Month-on-month, inflation rate was recorded at 0.1 percent. Inflation Rate in Czech Republic averaged 4.61 percent from 1993 until 2016, reaching an all time high of 21.90 percent in February of 1993 and a record low of -0.40 percent in January of 2003. Inflation Rate in Czech Republic is reported by the Czech Statistical Office. (Trading Economics, 2016)

Tab. 1. Inflation in Czech Republic, Source: Czech statistical Office (2016a)

Year															
00	01	02	03	04	05	06	07	08	09	10	11	12	13	14	15
3.9	4.7	1.8	0.1	2.8	1.9	2.5	2.8	6.3	1.0	1.5	1.9	3.3	1.4	0.4	0.3

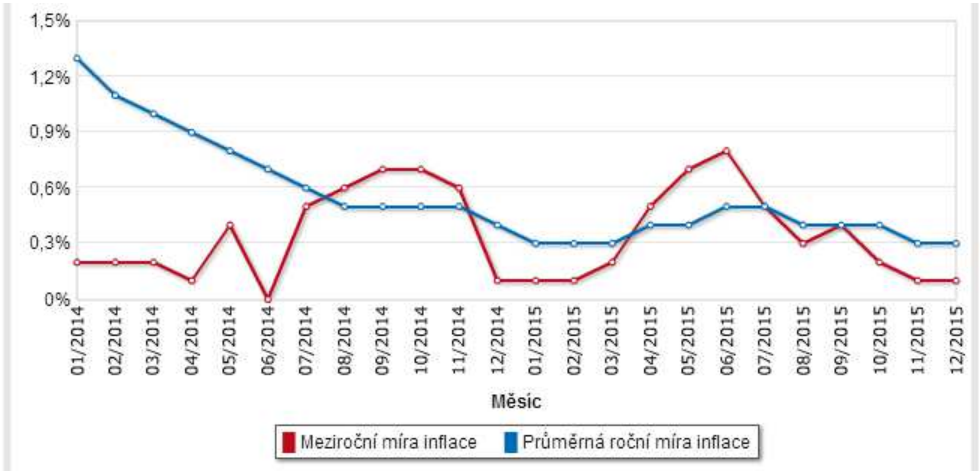

Fig. 1: Inflation in percentage in the Czech Republic, Source: Czech statistical Office (2016b)

4. Situation in EU

Euro area annual inflation was -0.2 % in February 2016, down from 0.3 % in January 2016. A year earlier, the rate was -0.3 %. The flash estimate of February, published on 29 February 2016, was -0.2 %.

Looking at the main components (see Fig. 2) of euro area inflation, services had the highest annual rate in February (0.9 %, compared with 1.2 % in January), followed by non-energy industrial goods (0.7 %, stable compared with January), food, alcohol & tobacco (0.6 %, compared with 1.0 % in January) and energy (-8.1 %, compared with -5.4 % in January). (Eurostat, 2016)

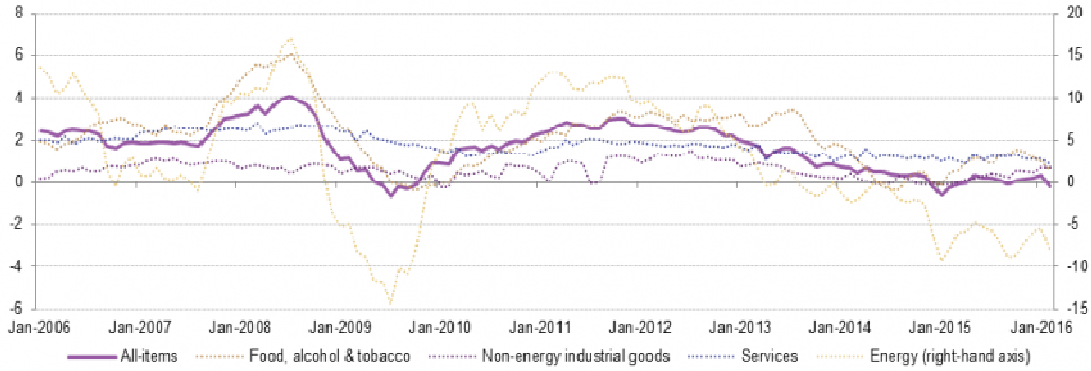

Fig. 2. Euro area annual inflation and its main components, 2006-February-2016, Source: Eurostat (2016)

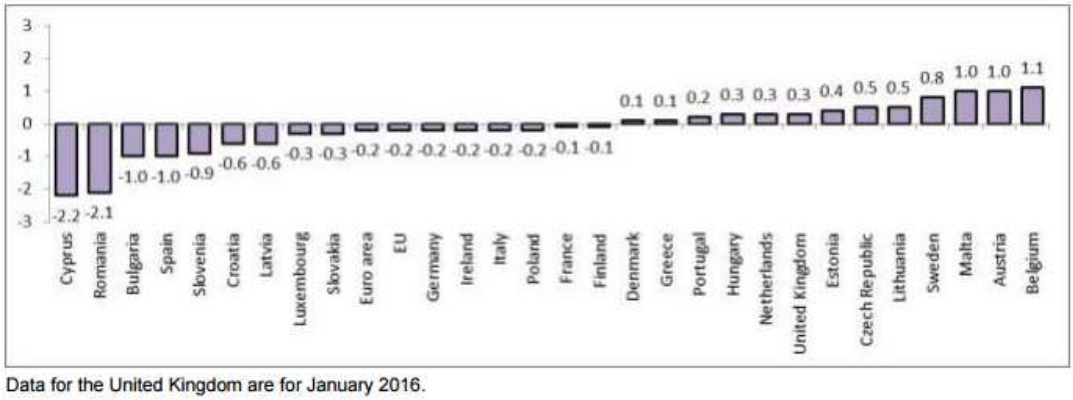
These figures come from Eurostat, the statistical office of the European Union. In February 2016, negative annual rates were observed in fifteen Member States (See Fig. 3). The lowest annual rates were registered in Cyprus (-2.2%) and Romania (-2.1%). The highest annual rates were recorded in Belgium (1.1%), Austria and Malta (both 1.0%). Compared with January 2016, annual inflation fell in twenty Member States, remained stable in one and rose in six. The largest upward impacts to euro area annual inflation came from restaurants and cafes (+0.13 percentage points), rents (+0.08 pp) and fruit (+0.06 pp), while fuels for transport (-0.49 pp), heating oil (-0.24 pp) and gas (-0.10 pp) had the biggest downward impacts. (Eurostat, 2016a)



Data for the United Kingdom are for January 2016.

Fig. 3. Annual inflation rates (%) in February 2016, in ascending order, Source: Eurostat, (2016a)

5. The Impacts of Deflation

Among the most important consequences of deflation are generally cited as follows (some economists disagree with them, especially with the first point): households are postponing

consumption in the deflation, companies will lay off in the deflation, labour productivity growth, the decline in bank lending and deflation, deflation as a result of the economic growth, confiscatory deflation etc. (Kohout, 2013, Šíma, 2002)

6. Discussion

The inflation target of the Czech Republic and the EU is 2 %. From the above it is necessary to consider whether the current level of inflation is in the Czech Republic and in the EU really so bad as the individual states present and whether it is necessary to target inflation. In the further research it is necessary to examine the actions of the central banks focused on the strengthening or weakening of the currency. In the Czech Republic will be investigated the effects of the intervention measures of the Czech National Bank on the depreciation of the crown and their consequences on the economy of the Czech Republic.

A hypothetical, unconventional tool of monetary policy that involves printing large sums of money and distributing it to the public in order to stimulate the economy. Helicopter drop is largely a metaphor for unconventional measures to jumpstart the economy during deflationary periods. While "helicopter drop" was first mentioned by noted economist Milton Friedman, it gained popularity after Ben Bernanke made a passing reference to it in a November 2002 speech, when he was a new Federal Reserve governor. (Komarek, 2016)

7. Conclusion

As was mentioned above, deflation can be, under certain conditions, for the real economy significantly greater threat than classic inflation as we know it. There is therefore not deflation as deflation. A mere drop in prices is not yet a problem. Problems occur in a situation where there is a decline in prices caused by a decrease in the volume of money in the economy, a credit contraction and similar phenomena. A similar situation is always connected with the economic recession and all negative phenomena that accompany it. The development of inflation in the Czech Republic and in the European Union will depend on the further economic development of important macroeconomic indicators (mainly GDP).

Abstract

Healthcare is currently facing a shortage of physicians and nurses, on the supply side. The demand side expects an increase in the burden in future years, associated with specific types of diseases such as chronic diseases or neurodegenerative diseases related to the population aging.The aim of this paper is to analyse the state of health services in the Hradec Kralove Region. In 2013 the age structure of the population of Hradec Kralove Region differed to the nationwide structure mostly in higher proportions of the population aged 65+. In the region we can expect a growing number of deaths in the following groups: circulatory system diseases, neoplasms, respiratory diseases, infectious and parasitic diseases, blood diseases, diseases of the genitourinary system, endocrine diseases, intellectual and behavioural disorders, diseases of the nervous system, birth defects, muscle and connective tissue diseases. Therefore, more attention is paid to one of the fields in which there are future expectations of increased demand, specifically to cover the care in the field of urology.

Keywords: Healthcare, supply, demand, Hradec Kralove Region.

Introduction

Healthcare markets shows within their supply and demand certain specifics involving the expected behaviour of physicians, uncertainty of the final product and the terms of the offer (Arrow, 1963). The definition of healthcare under the Act 372/2011 Coll. on healthcare services and terms and conditions of their provision (Healthcare Services Act) says that it is a set of activities and measures undertaken by individuals for the purpose of:

1. prevention, detection and elimination of the disease, defect or health condition (hereinafter the "disease"),

2. maintaining, restoring or improving the health and functional condition,

3. sustaining and prolonging life and alleviating suffering,

4. helping reproduction and childbirth,

5. assessment of health condition,

preventive, diagnostic, therapeutic, medical rehabilitation, nursing or other medical procedures performed by medical staff (hereinafter referred to as "medical procedure") for the same purpose.

Individual demand for healthcare is unpredictable due to ignorance of their own health condition, as part of the population it is much more predictable. Furthermore it is irregular, probably increasing with age and intensive in the case of pain or illness. The demand also shows external benefits (social interest in the healthcare of individuals as well as the population as a whole). Specifics of the offer are reflected in its limited flexibility and competition. Generally, the offer on perfectly competitive markets is characterised by free entry into the industry, but in healthcare it isn't like that, in healthcare it is typical that the performance of the medical profession is tied and regulated to the

licensing, and the training of medical personnel is costly and challenging in the content. The limited competition varies between different market segments and providers compete among themselves and also with other sectors for available resources. A physician acts as a service provider affecting the cost, amount of the services and their structure.

The theory of health markets is developed further in 1972 by M. Grossman. It singles out health as a separate item of human capital and calls it health capital (HC). His model of demand for healthcare is based on the argument that human capital as the set of knowledge and experience acquired by education and practice increases productivity in the labour market and beyond, while HC determines the number of days that can be used for work or non-market activities (e.g. rest). Demand for healthcare therefore is not the primary demand according to Grossman, but it is derived from the demand for HC (Grossman, 1972). In the Czech Republic the findings of Grossman's model can be applied sparingly because it is a country with compulsory health insurance. Visiting the doctors is routinely perceived as a financial investment in your own health.

Furthermore, this issue was dealt by S. J. Mushkin, who tracks the results of state investments in the health and education of the population. He argues that it is pointless to examine investments in health care at the level of individuals, since the biggest changes in mortality and morbidity occurs in the context of societal conventions or state-run programs (Mushkin, 1962). In this case, individuals have no obligation of choice according to their preferences. The expenditure is either directed by the state authority such as health insurance, or it is socially unacceptable not to carry out the investment.

The aim of this paper is to analyse the state of health services in the Hradec Kralove region, focusing on one of the fields in which the future expectations foresee increased demand due to the expected increase in treated illnesses. The specification of demand for the amount of services, physicians and beds in various fields is based on several factors. It is the health situation of the population, which will be characterised by the development of deaths among the major groups of diseases and the number of hospitalised patients in the Hradec Kralove Region. Furthermore, the efficiency of the care, for example, an average treatment time, which will be analysed on the supply side..

1. Methods

The basic methods used for data processing include creation of time lines from publicly available sources such as National Register of reproductive health or Czech Statistical Office (CSO). Based on the existence of time lines, the value for the future period is then determined using linear prediction methods. In case of fluctuations in the time lines, the place of trend change in time line is determined using Simple Moving Averages, linear trend and Exponential Moving Averages and the prediction is developed then from that point. A Simple Moving Average (SMA) is calculated based on the relationship:
$SMA=(I_1+I_2+ ... +I_n)/N$, where
n – is the length of the reference period,
I – is the indicator used to calculate the average,
N – is the length of the period.

Exponential Moving Average (EMA) is calculated based on the relationship:
$EMA = I_n * K + EMA_{n-1} * (1 - K)$
EMA - Exponential Moving Average for *n* period,
n - is the length of the reference period,
I_n – is the indicator used to calculate the average,
K – is the proportion of the number 2 and number of monitored periods +1.

The calculations were performed using MS Excel, where the linear trend was calculated using the Lintrend function. The suitability of the linear model will be verified by the determination coefficient, which reflects the strength of the monitored variables dependence.

2. Analysis of the current condition of the population in the Hradec Kralove Region

The age structure of the population of the Hradec Kralove Region differed to the nationwide structure in 2013 primarily with a higher share of population aged 65+ (Table 1). The Hradec Kralove Region is afflicted by the so called demographic ageing, i.e. the process during which the age structure of the population is gradually changing in a way that the proportion of people over 65 years increases and the proportion of people younger than 15 years decreases. I.e. the older age groups grow relatively faster than the population as a unit. This problem is topical in the entire Czech Republic and across Europe.

Tab. 1: Percentage of population age groups in the Hradec Kralove Region and the Czech Republic

Age	HK		CZ	
0-14	82,276	14.90%	157,7455	15.00%
15-64	367,934	66.70%	7,109,420	67.60%
65+	101,699	18.40%	1,825,544	17.40%
Total	551,909	100%	10,512,419	100%

Source: (CSO, 2015)

The ageing population in the Hradec Kralove Region as well as the entire Czech Republic is suggested by the increase of the average age of the population (the arithmetic average age of all individuals in the given population). It continues to grow and in the period 2002-2013 in the Hradec Kralove Region it increased by 2.4 years. Compared to the whole country the value of the average age is permanently higher, and the difference is rather widening.

The existing demographic data could be summarised into the following basic trends:

- Total population of the Hradec Kralove Region has decreased by 10,000 inhabitants since 1980. Current status (by December 31, 2013) is 551,909 inhabitants. For the past 33 years there is a 2% change.
- Population growth is consistently below the national average.
- The largest population growth in the years 2002-2013 was recorded in 2007 in the amount of 2,569 individuals. The main reason for this increase was the migration balance.
- Ageing population affects the Hradec Kralove Region very negatively and it is above the national average comparison. The proportion of people older than 65 years is over 18%.
- The age index exceeded 100% in 2005, it is consistently higher than in other regions, except for the capital city of Prague and Zlin Region.

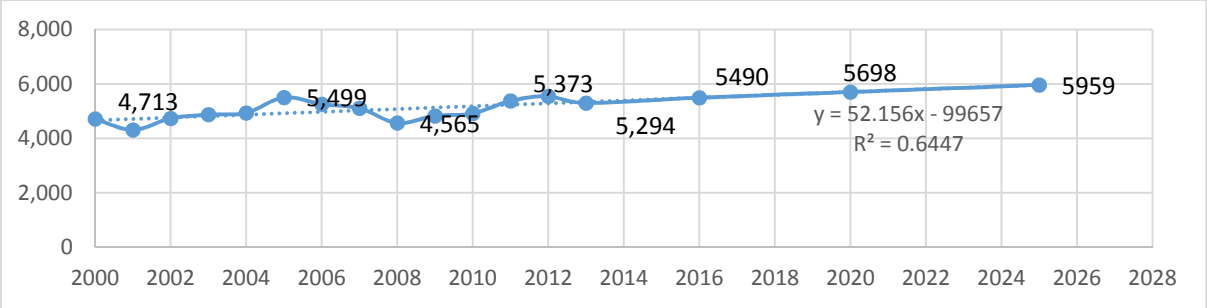
Compared to the computed values of 2015, an increasing number of deaths in the following groups can be expected in the Region: neoplasms, respiratory diseases, infectious and parasitic diseases, blood diseases, diseases of the genitourinary system, endocrine diseases, intellectual and behavioural disorders, diseases of the nervous system, birth defects, muscle and connective tissue diseases. Conversely, a decline is expected in these groups: diseases of the nervous, circulatory system, digestive system diseases, certain conditions originating in the perinatal period. The decrease is also reflected in the total number of patients.

3. Demand and supply of healthcare in the Hradec Kralove Region

Specification of the demand for number of services, amount of physicians and beds in various fields is based on several factors. This is a health status of the population. Furthermore, the efficiency of the care, i.e., for example, an average treatment time, which will be analysed on the supply side within the individual fields.

3.1 The market situation in the field of urology

Development of the number of hospitalisations in the field of urology in the Czech Republic shows a rising trend. In 2012, there were 81,682 patients. For 2025, the assumption is up to 89,557 patients (IHIS, 2015). On the contrary the number of deaths decrease, between 2000 and 2012 the reduction was by more than 200 people. The prediction also assumes further radical reduction. Namely: the situation in the Hradec Kralove Region shows that the numbers of admissions to hospital beds will grow, in 2025 nearly 6,000 patients are expected (Graph 1).



Graph 1 Development of the number of hospitalised patients, inpatient care in hospitals in the urology department

Source: own calculations based on the data from National Register of reproductive health

3.2 Analysis of the supply of care in the field of urology in the Hradec Kralove Region

Health care supply is specified by the number of physicians, number of departments, beds, their usage and capacity.

The hospital urology department has a stabilised number of departments, decreasing number of beds, as well as decreasing number of physicians. When looking at the total number of physicians in the region and their ten-year age group, the increase in groups from 50+ years is apparent. A clear decline is in the group of up to 29 years and in the remaining two categories, the numbers were variably developed with the decline in the past few years. The numbers of physicians, therefore seem to be sufficient for the next ten years, but after this period, while maintaining the trend, a fundamental lack of physicians is going to apparent (Table 1).

Tab. 1: Physicians according to the main field of activity – Urology

	up to 29	30 - 39	40 - 49	50 - 59	60 - 69	over 70	Total
2000	6	11	11	2	1	1	32
2001	4	13	11	3	1	1	33
2002	3	12	11	3	2	0	31
2003	3	11	13	3	2	0	32
2004	4	10	12	5	2	0	33
2005	6	12	10	6	3	0	37
2006	4	13	10	7	3	0	37
2007	6	13	10	7	3	0	39
2008	4	13	11	7	4	0	39
2009	3	15	8	11	3	0	40
2010	3	14	8	12	4	1	42

2011	3	12	9	12	5	1	42
2012	4	11	9	12	4	1	41
2013	2	9	12	11	4	1	39
2016	2.7	12.1	8.7	15.4	5.5	0.8	45.1
2020	2.1	12.1	8.0	18.9	6.5	0.9	48.5
2025	1.4	12.1	7.1	23.2	7.8	1.1	52.8

Source: own calculations based on the data from National Register of reproductive health

Physician transition index between groups indicates stabilisation of the numbers in relation to the transition between the groups. Index 3 which is in the age group of 30-39 indicates that the numbers of physicians are secured not only by transition from the previous group (the value would be at level 2, since the graduates in the age interval of 25-30 years appear in the category up to 29 years for the monitored period), but also by the arrival of more physicians from elsewhere (table 2).

Tab. 2: Index of physician transition between groups in the field of urology

	30 - 39	**40 - 49**	**50 - 59**	**60 - 69**	**over 70**
2000/2010	2.3	0.7	1.1	2.0	1.0
2001/2011	3.0	0.7	1.1	1.7	1.0
2002/2012	3.7	0.8	1.1	1.3	0.5
2003/2013	3.0	1.1	0.9	1.3	0.5
average	3.0	0.8	1.0	1.6	0.8

Source: own calculations based on the data from National Register of reproductive health

Nearly all age groups have the index around 1, which indicates the stability of the field, physicians from the urology field even come from other regions. Only in the highest age category is the value lower than 1, which may be caused by retirements.

Inpatient care in the hospitals in the HK Region is specific by the declining number of treatment days, decreasing average time of treatment, reduction in the use of beds and bed capacity. Occupancy of beds in 2013 was at a value of 57.5% (Table 3). If other circumstances in the field do not particularly change, the occupancy of beds will continue to decline, therefore it is advisable to consider a reduction in beds. In 2008 the number of days of treatment significantly decreased so did the annual bed occupancy. Average treatment time within the prediction came very low, up to the value of 2. The decreases over the monitored period were up by 100%, which may be influenced by the number of one-day performances.

Tab. 3: Inpatient care in hospitals - number of treatment days, the capacity of beds and occupancy of beds in urology

	Number of treatment days	**Average length of treatment**	**Annual bed occupancy**	**Beds**	**Annual capacity of beds**	**Occupancy of beds**
2000	29,279	6.2	42340	116	42340	69,2%
2001	25,472	5.9	42,340	116	42,340	60.2%
2002	26,496	5.6	42,340	116	42,340	62.6%
2003	26,391	5.4	42,340	116	42,340	62.3%
2004	26,691	5.4	42,340	116	42,340	63.0%
2005	28,446	5.2	42,340	116	42,340	67.2%

2006	26,300	5.0	42,340	116	42,340	62.1%
2007	26,087	5.1	42,340	116	42,340	61.6%
2008	21,190	4.6	40,880	112	40,880	51.8
2009	21,642	4.5	40,150	110	40,150	53.9%
2010	22,039	4.5	39,420	108	39,420	55.9%
2011	21,293	4	39,420	108	39,420	54.0%
2012	21,774	3.9	37,960	104	37,960	57.4%
2013	21,403	4	37,230	102	37,230	57.5%
2016	19,368	3.3	34,936	108	39,594	51.6%
2020	17,478	2.6	31,807	100	36,604	48.1%
2025	15,115	1.8	27,896	90	32,867	43.8%

Source: own calculations based on the data from National Register of reproductive health

Based on the above data it is possible to model several scenarios of further development. Scenario 1 - maintaining the number of beds would be related to the following successive assumptions:

- maintaining the availability of care in the region in the current range,
- decrease in bed occupancy
- the same need of the medical personnel,
- decline in revenue from insurance company
- economic non-efficiency growth, ...

Should there be a decision about reduction in the number of beds and the number of departments - Scenario number 2, it is expected:

- reduction in the availability of care in the region in the current range,
- increase in the utilisation of beds
- reduced need for medical staff,
- economic non-efficiency growth.

The latest variant forms Scenario 3 - reducing the number of beds and the preservation of the number of departments, i.e.:

- change in the availability of care in the region in the current range,
- increase in the utilisation of beds
- reduced need for medical staff,
- maintaining the current administration to maintain the number of departments, economic efficiency will not change so radically as in the previous variant, at the same time the availability of services will not be reduced so much.

4. Summary and Discussion

Development of the number of hospitalisations in the field of urology in the Czech Republic is growing, on the contrary the number of deaths decrease. The numbers of hospitalised patients in hospital beds in the Hradec Kralove Region increases. The development of the number of physicians in curative preventive care and hospital care varies. While in outpatient care the trend shows stagnation, in hospital care it declines. All with the views over the following ten years. By looking at the age groups of physicians in increments of ten years there is an obvious increase in the 50+ years groups. There is a clear decline in the group up to 29 years. The number of physicians, therefore, seem to be sufficient for the next ten years, but after this period, while maintaining the trend, a

fundamental lack of physicians will appear. Another monitored outcome was the number of beds and their utilisation.

The number of beds for the period 2000-2014 decreased by 12 beds. Utilisation was at a value of 57.5% in 2013, which, given the assumptions of a possible increase in the number of patients represents a fair value providing some reserve. Hospital departments in the urology field has a stable number.

Conclusion and Future Research

The market for health services and means shows certain specific and more recently also changes in supply and demand, due to the demographic development, technology development and economic development (Marešová et al., 2015). The aim of this paper was to analyse the status of health services in the Hradec Kralove Region, focusing on one of the fields in which the future expectations foresee an increased demand due to the expected increase in treated illnesses. An analysis of the field of urology showed that over the next ten years, the demand is covered in terms of the number of beds and in terms of a sufficient number of physicians. However, the next season requires us to deal timely with the security of personnel, particularly because the age group of physicians up to 39 years shows a gradual decline. It will also be necessary to conduct interviews with doctors in various fields and to propose cost-saving measures

Apiculture – An Opportunity for the Romanian Agri-Food Production

Silvius Stanciu, Dunărea de Jos University of Galati, Romania, sstanciu @ugal.ro

Abstract

Romania has an important potential in producing honey, a high quality of apicultural products and the favorable conditions for ecological production, which can constitute market advantages on the global market for apicultural products. Recent development of the national apiculture sector through European and national financing must be followed by investments in quality and modern processing units, which can ensure an added value to exported products. Fragmentation of production and insufficient marketing of the products are the weak points of the local sector. The tradition and continuity of the honey production, exports towards traditional external partners, the opening of new markets, ecological production or the diversity of the range of products are the opportunities from which local beekeepers can benefit in the next period. This paper is an analysis of the Romanian sector and proposes future development directions which can ensure a high degree of competiveness for local production on the international market.

Keywords: apiculture, market, opportunities, Romania

Introduction

The production of bee honey represents a traditional activity on Romanian territory, being a part of the culture and history of our civilization. Archeological findings and a large number of places with an apicultural resonance are proof of the continuity of apiculture in Romania.

According to Codex Alimentarius (1981), "Honey is the natural sweet substance produced by honey bees from the nectar of plants or from secretions of living parts of plants or excretions of plant sucking insects on the living parts of plants, which the bees collect, transform by combining with specific substances of their own, deposit, dehydrate, store and leave in the honey comb to ripen and mature". Bee honey is a food with special nutritional properties, with proven therapeutic characteristics, used in alternative and complementary medicine or in traditional Romanian treatments. Historical proof concerning the use of honey as medicine is presented on Sumerian clay tablets, emblazoned 5000 years ago, which mention that honey is a remedy for skin ulcers (Georgescu, 2009). Manyi–Loh, Clarke and Ndip (2011) present the nutritional and therapeutic effects of honey on the consumer, caused by the anti-microbe and anti-inflammatory action and the high anti-oxidant potential, being recommended as alternative to modern medical treatment.

Tan et al. (2009), make a comparative study concerning the anti-bacterial properties of the tualang honey types (*Koompassia excelsa)* and manuka, suggesting that the Malaysian product can be used as alternative therapeutic treatment against some microorganisms, especially *A. baumannii and S. maltophilia.*

Lusby, Coombes and Wilkinson (2002), evaluate the potential use of honey in the treatment of wounds and skin burns, emphasizing its anti-inflammatory and immunostimulant action, reduction of infection and facilitating of healing for burns, ulcers and other skin wounds. Outside the therapeutic properties, honey is a food used for human consumption due to its high sugar composition (carbohydrates –fructose and glucose and over 25 types of saccharides), small quantities of proteins, enzymes, amino-acids, minerals, oligoelements, vitamins, aromatic components and polyphenols. According to Bogdanov et al., (2007), honey has a variety of positive nutritional and health effects, if consumed at higher doses of 50 to 80 g per intake.

International Honey Production and Trade

According to FAO data, the global honey production, in a slight increase between 2009-2012, is estimated at 1.5 million tons, of which over 400,000 tons are traded on the international market. The main global honey producers in 2012 were China (436,000 tons), Turkey (88,162 tons), Argentina (75,500 tons) and the Ukraine (70,134 tons). With a quantity of 23.062 tons of honey produced, Romania occupied the 17th position in the global hierarchy (table 1). Europe and South-East Asia dominated the honey global market, being confronted in the last period with the massive loss of bee colonies (CDD - Colony Collapse Disorder) caused by stress of bees, epidemics, irrational use of chemical treatment on agriculture cultures. According to Dumitrescu's research (CRPCIS, 2012), although presently we can observe a balancing of the global commercial balance, the global honey market will be confronted with an offer deficit, caused by unfavorable climate changes, CDD manifested in the US and spectacular growth of demand in China and India. The evolution of global honey trade is presented in tables 1 and 2 (in the case of blank positions there are no data in the statistics consulted).

Table 1. Importers for natural honey (ITC Code product 0409) (USD)

Region/Country	2011	2012	2013	2014	2015

China	12,906	26,208	42,932	58,612	74,74

(Source Author, by using Interantional Trade Center Data, Trademap 2016)

The main importing areas are America (US), European Union, Asia (Japan and China) and the Middle East (Saudi Arabia). Between 2002 – 2011 China reduced the export volume, because of anti-dumping measures imposed by the US and the interdictions on community market caused by the presence of antibiotics in the honey (Chloramphenicol). Starting with 2012 a revival of Chinese honey exports is noticed, with an improvement in honey quality, illustrated also by the lack of notifications from the RASFF in the past 3 years (RASFF, 2016).

(Source Author, by using International Trade Center Data, Trademap 2016)

The US covers almost half of the internal consumption by local production. EU is a net honey importer, because the european production only covers 61,6 % of its consumption. The level of community consumption has been constant throughout the years, with an average of 0,70 kg/capita. The percentage of Romanian imports on the global market is negligible, their value being of 6,176 USD, representing around 0.26 % of global imports.

Global honey exports have reached a value of 2.3 million USD in 2014, the main exporting countries being China, Argentina and New Zealand. Romania occupied position 13 in the exporting countries globally, with a quantity of around 46,000 tons (table 2).

Quality Conditions for Honey. Notifications for Honey Products on the Community Market

The quality conditions for honey are established in the Codex Norms Alimentarius Standard for Honey (Codex STAN 12/1991, Rev 1987, 2001), which also precise the two honey categories differentiated according to production modalities –Blossom honey (nectar honey), produced based on the nectar of plants and honeydew honey, which comes mainly from excretions of plant sucking insects (*Hemiptera*) on the living parts of plants or secretions of living parts of plants.

The standard specifies the main physical, chemical and microbiological components of honey, the sampling and control methods, regulations concerning food contaminators, (heavy metals, residues and veterinary medicaments), hygiene conditions of the products and particular specifications concerning the labeling of products, which complete the general regulations of General Standard for the Labeling of Pre-packaged Foods (CODEX STAN 1-1985).

In the European Union, regulations concerning the quality of honey are described in Directive 2001/110/CE concerning honey, which states, additional to Codex STAN 12/1991, the honey categories according to the manner of production (honey with honeycomb, honey with honeycomb pieces or honeycomb, drained honey, pressed honey or filtered honey) and defined honey destined for agri-food industry. Both regulations, the international and the community one, contain details concerning the obligatory specifications on the label concerning the type of honey (floral or vegetal), regional origin, territorial or topographic, specific quality criteria.

The composition and quality of the honey are influenced by botanic origin, processing methods, storage and trading used. According to Food Protection and Defense Institute (2016), being a relatively expensive product, specialty literature signals a series of actions for defrauding honey (dilution, substitution, adding of foreign components, unauthorized medical treatment, wrong labeling, or forgings), coming especially from China or the near East. The Rapid Alert System for Food and Feed (RASFF) has notified in the period 2000-2016 a number of 304 products from the honey and royal jelly categories, with a maximum of 44 products signaled as being not according access to the European market in 2003 (figure 1).

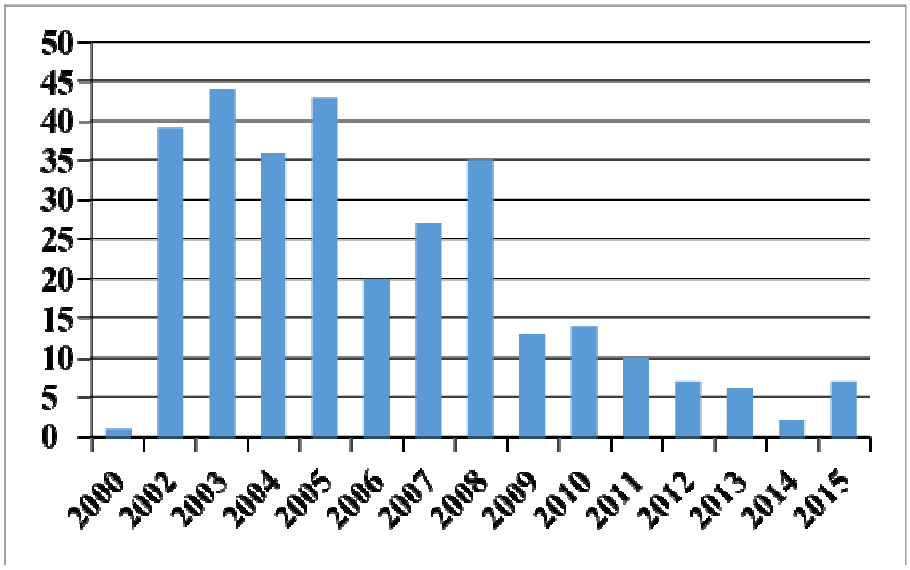

Figure 1. RASFF notifications of honey and royal jelly
(Source Author, by using RASFF Data, 2016)

The main typed of notifications made in the community system have been notifications, followed by alerts, border rejection and information for follow up (figure 2). The most alerts have been addressed to honey products which have presented in their composition contaminants in the category of unauthorized antibiotics, used for treatment of bee populations.

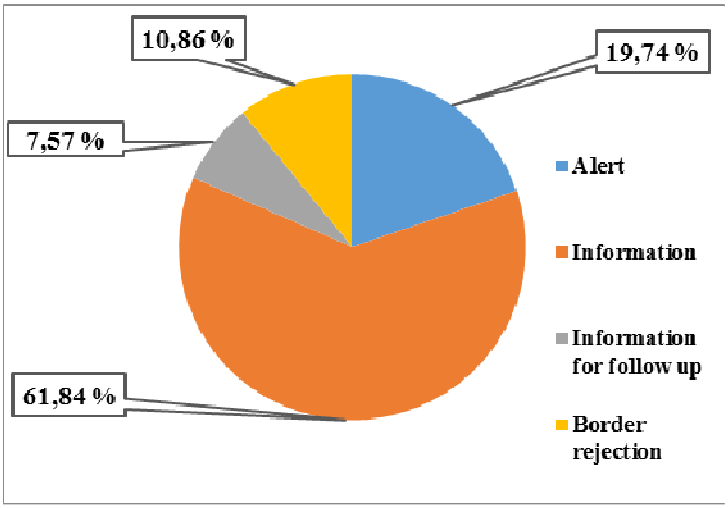

Figure 2. Categories of notifications from RASFF for honey and royal jelly products
(Source Author, by using RASFF Data, 2016)

The border rejections, most for honey coming from China, have had as a cause the presence of antibiotics, more frequently erythromycin or in some cases, the not accordingly packaging or hygiene for transports from the Ukraine. Honey is a natural product, in which the presence of contaminants is strictly

limited and the presence of food additives or other ingredients not specific for honey is strictly forbidden. Chinese products are the ones with the most notifications in the analyzed period, representing over 20% of the total registered in the community. Other states which have produced not according shipments of honey have been Argentina, Ukraine, Portugal or Turkey (figure 3).

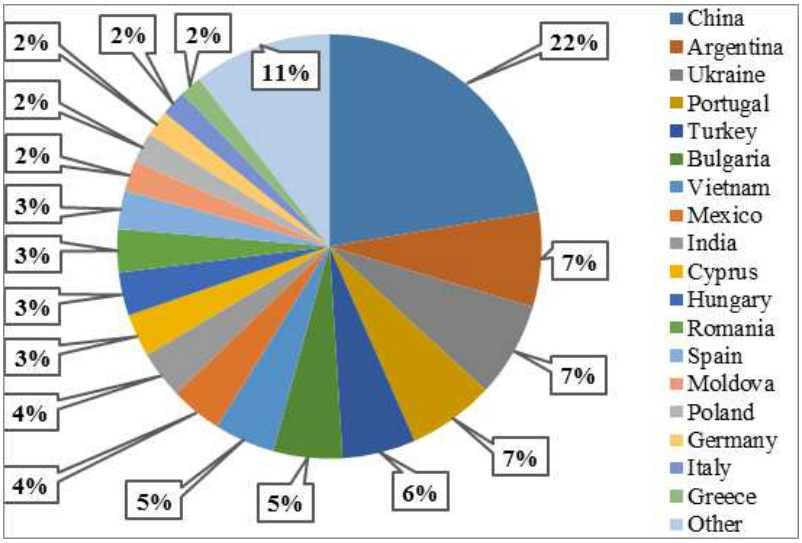

Figure 3. Geographical areas from which come honey and royal jelly products notified by the RASFF
(Source Author, by using RASFF data, 2016)

Romania generally is a safe production area for honey products, being relatively few notifications concerning it on the community market (table 3). Thus, between 2002- 2006 there have been 10 notifications issued by member states, of which 2 alerts and 8 notifications, all signaling the presence of unauthorized medicine in the shipments of Romanian honey exported to European partners. The community integration has brought new regulations in local honey production, after 2007 being no more notifications concerning the Romanian honey products. Romania has transmitted just 2 notifications of the border rejection type in the community network, concerning honey shipments in the Republic of Moldavia, respectively for absence of health certificate (2013) and unsuitable transport conditions (rusty and deteriorated barrels) for honey from Moldova (2014).

Table 3. RASFF notifications regarding honey and royal jelly

Year	Notifications	Country/ notifications	Categories of notifications and nonconformities
2002	3	Italy /2 I Austria /1 A	Information (I) - sulphathiazole unauthorized (67 µg/kg - ppb) - oxytetracycline unauthorized (18 mg/kg - ppm) in acacia and lime honey Alert (A) - streptomycin unauthorized (165 µg/kg – ppb)
2003	3	United Kingdom/2 I Denmark/1A	Information - prohibited substance chloramphenicol residues of veterinary medicinal products (0.3µg/kg – ppb) from Moldova and Romania - streptomycin unauthorized (200 µg/kg - ppb) Alert - prohibited substance - chloramphenicol (0.5 - 1.6 µg/kg - ppb) in acacia honey from Hungary and from Romania
2004	3	Germany/2 I	Information - streptomycin unauthorized (72 µg/kg - ppb)

		Sweden/ 1I	- streptomycin unauthorized (0.15 mg/kg - ppm) - sulphathiazole unauthorized in acacia honey (125 µg/kg - ppb)
2006	1	Hungary/1 I	Information - streptomycin unauthorized (47.7 µg/kg - ppb)

(Source Author, by using RASFF Data, 2016)

Honey Production and Trade for Romania

According to FAO data (2016), in the EU the main honey producers are Spain, Romania, Hungary and Germany, which cumulated make for 50% of the community honey production. Imported quantities also come from Russia, Ukraine, which sum up to 40% of the European apiculture.
Romanian apiculture uses bees from the *Apis Mellifera L family*, local breed *Apis Mellifera Carpatica*, well adapted to local climate conditions, but also import breeds, especially the *Buckfast* hybrid, *Apis mellifera carnica*, *Apis mellifera lingustica* or *Apis mellifera caucasica*. According to Iordache (2015), the protection and improvement of the local bee breed is necessary as is avoiding import breeds which are not as well adapted to climate conditions and can lead to the dependency of Romanian beekeepers on foreign breeds.

According to Ministry of Agriculture and Rural Development MARD (2016) data surfaces cultivated with technical plants at the disposal of beekeepers in 2015 were of 1.062.416 ha for sunflower, 435.872 ha for canola and 2.297 ha for coriander, easily decreasing from previous years. In 2015 MARD (2016) census registered in the 42 counties of the country 1,585,531 bee families, unevenly distributed in industrial units (20,027l families, companies and private associations (57,590 families) and family farms (1,507,151 bee families). The opinion of specialists is that the market in Romania is far from reaching maximum capacity, the available melliferos potential being able to ensure the development of a bee population between 1,800,000 families (Călin, 2010) and 2,700.000 families (Banu, 2016).

The National Apiculture Program (2008-2010) lead to a revitalizing of the apiculture sector, by subsidizing the associative beekeeper forms to purchase biological material to repopulate the bee population, respectively for the prophylaxis and virosis control. The organization forms in the honey production sector are mainly represented by associations and cooperatives, the number of groups of producers being the smallest. In the purchasing, processing and trading fields 19 companies activated organized under the form of Ltd (figure 4).

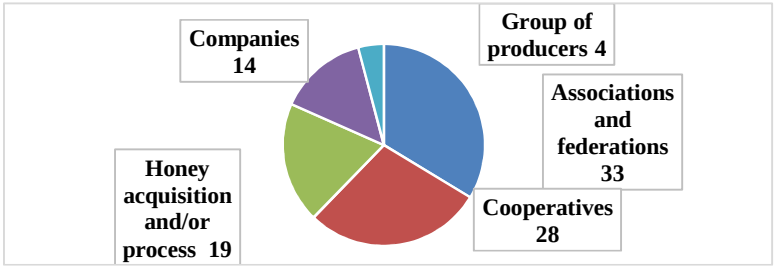

Figure 4. Organizing form of producers of apiculture in Romania (2015)
(Source Author, using the MADR Data, 2016)

The quantity of honey produced in 2015 has been evaluated at about 35 tons, on which over half has been sold to industrial processors (figure 5). Around 30% of the production has been destined for home consumption, a quantity of around 5 tons being deposited for later consumption.

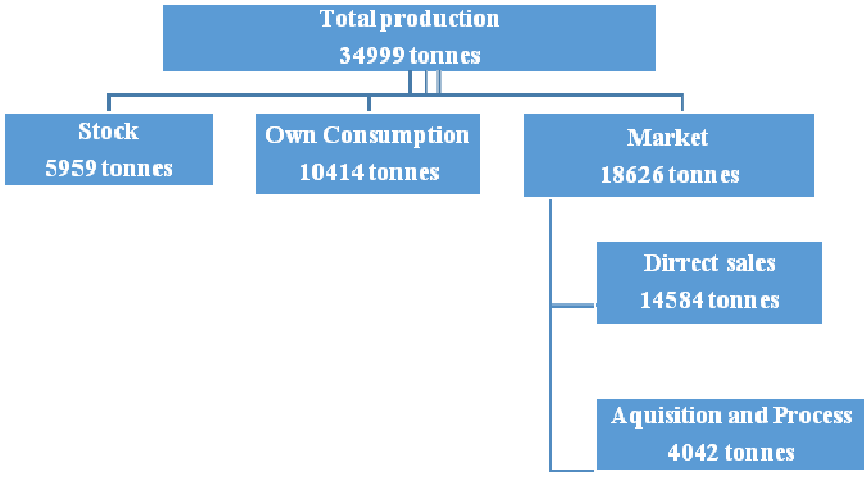

Figure 5. Romanian production of honey (2015) and its destination
(Source Author, using MARD Data, 2016)

Out of the 42 counties of Romania, the most productive is Vâlcea, with a honey production of over 4 tons, followed by Dâmbovița and Mureș. The last positions in the national classification are occupied by Argeș, Covasna and Bucharest County (figure 6).

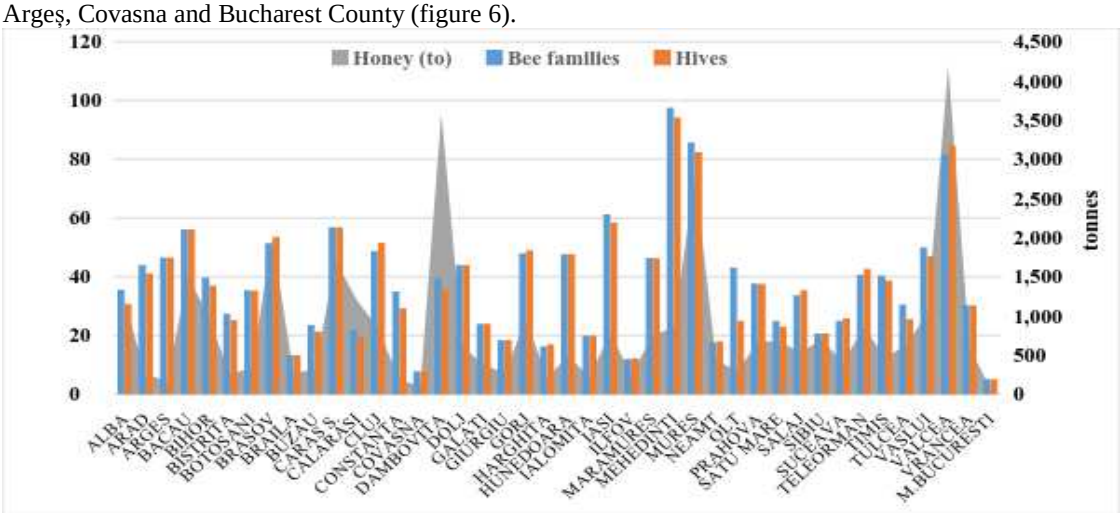

Figure 6. Bee families, hives and honey production, by county
(Source Author, by using MARD Data, 2016)

Romania honey production presents a constant growing tendency in the past years, fluctuations caused by climate conditions. National support programs for the apiculture sector have lead to the increase of the number of bee families and to a growing evolution of honey production.

Even if after the joining of the community space there has been a significant increase of annual consumption per capita, which evolved from around 0.5 kg in 2007 to 0,7 kg in 2014, Romania remains below the average of occidental Europe (5 kg Denmark 1,5-2 kg Germany, 1,5 kg Benelux), important stocks being made for export.

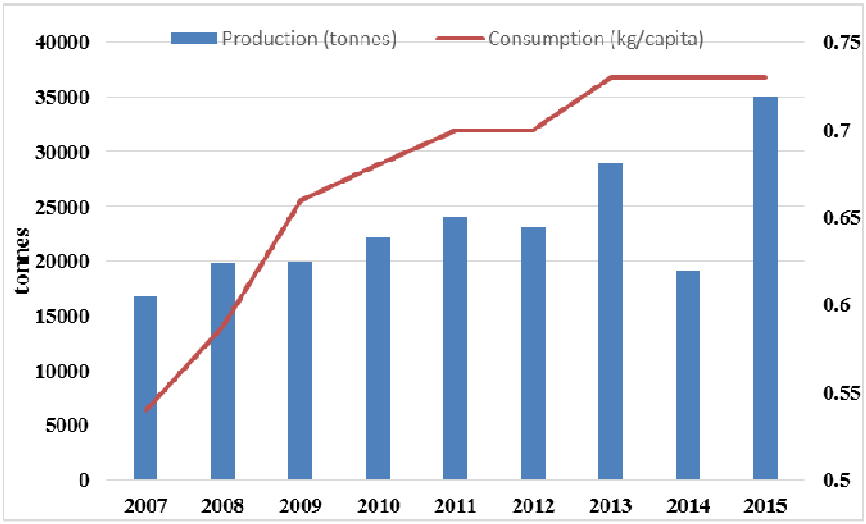

Figure 7. Romania honey production and consumption
(Source Author, by using NIS data, 2016)

Romania's external honey trade presents an excedentary balance, the export surpassing the import significantly, the latter being insignificant (figure 8).

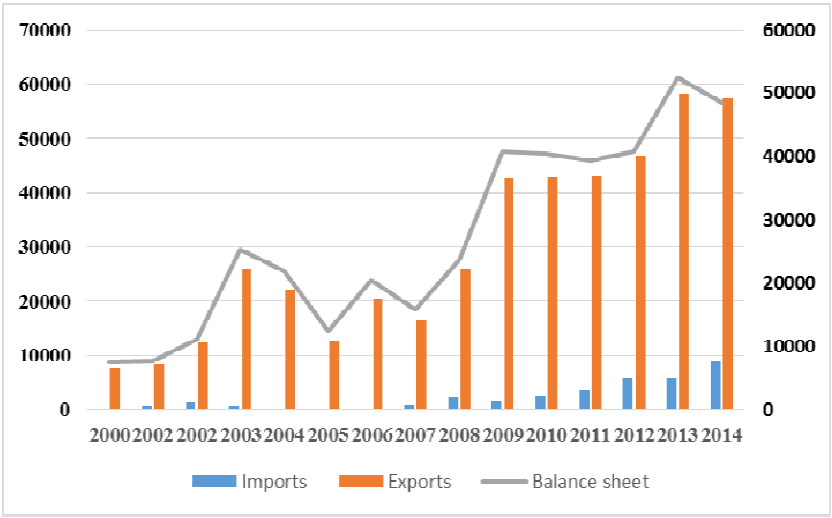

Figure 8. External honey trade of Romania (thousands USD)
(Source Author, by using NIS data, 2016)

The main commercial partners of Romania are the Member States, where honey is exported at prices varying between 2.5 and 3.5 euro/kg, according to honey type (monoflower, poliflower or honeydew). Romanian farmers do not know how to take advantage of market opportunities, the added value of honey products being relatively reduced due to trasports made mostly in bulk (Dumitrescu, 2012).

The value of honey exports, made by the main commercial partners, is presented in table 2. Although a slight stagnation or even a small reduction of global honey quantities exported by Romania in the last 3 years can be observed, mainly caused by decrease of internal production (on reasons of unfavorable

climate), prognosis can be optimistic taking into account the increase in demand registered in the trade with China and in some community states.

Table 2. Romanian honey exports, per commercial partner (thousands USD)

(Source International Trade Statistics - Trade MAP, 2016)

Germany is the main destination of local honey exports, covering almost half of the total Romanian exports. Spain, Sweden and Poland are the Member States in which an increase of value of the products exported in the last years can be noticed. China registers a spectacular evolution of honey products import from Romania, with an increase in value of 10 times in the last 5 years. According to the Report made by the Romanian Center for Promotion of Commerce and Foreign Investments (Dumitrescu, 2012), the potential markets for selling Romanian honey products can be separated in 4 categories, according to the value of realized exports and the average annual export increase demand of Romania: growing markets (Germany, Great Britain, Italy, Austria, Poland, France, USA, Czech Republic, Canada, Switzerland, Luxemburg, Sweden); stagnating markets (Spain, Japan, Belgium), decreasing markets (Greece, Hungary, Singapore), new markets with high potential for local honey products (Slovakia, Israel, China, Kuwait). Romania can use the opportunities existing on the international markets, by growing the product offer to the high potential partners and covering the demand for traditional partners. Orienting towards ecologic production can represent a potential advantage for our countries.

Conclusions

Romania has natural advantages favorable to a superior quality honey production, which can be valued by the export of honey products on growing markets. Redressing primary production through community and governmental support by national programs destined for apiculture (PNA 2008-2010, PNA 2011-2013, respectively PNA 2014-2016) has created the necessary basis for production and for an important surplus for export. Investments in packaging and modern processing, which must continue, can lead to the increase of the quality of exported products, a bigger diversity of types of products and to an added value of the products exported in retail packaging, destined to the final consumer. The ecologic honey production can constitute an opportunity for the local sector, in the conditions of a possible stagnation of global market and of a fierce competition from emerging economies. The internal market presents high potential and retail opportunity for honey products made by Romanian beekeepers which must not be neglected, taking into account the present relatively low consumption, versus to other European states, and the growth tendency registered in the last period.

Abstract

Tourism exploits the natural and human potential of a country, enriching them continually, satisfying multiple human motivations. It has a multiplier effect, introducing unprecedented economic cycle sides such as landscape (for "consumption" which is to go to the site), hospitality, solicitude and information (geographical, cultural, historical, culinary, artistic etc). We consider the implications and considerations highlight the economic importance of tourism in that it is a means of diversifying economic structures; means of exploiting resources; creator and user of national income; creator of new jobs; stimulating investment. Seasonality is the dominant feature of tourist activity and should be considered in formulating marketing policy. Seasonality of tourism demand is an objective reality that deeply marks the entire activity of the entities involved in tourism. Thus, in this paper we analyzed the movement of tourists in the Danube Delta in recent years, using the moving average method geometric mean and the method of arithmetic mean, and applying formulas specific, we tried to predict who will be the number of tourists who will visit Danube Delta over the next two years.

Keywords: tourists, geometric mean method, analyzing tourist movement, seasonality coefficient

Introduction

The territory of the Danube Delta Biosphere Reserve, bordered by law, has a total area of about 580,000 hectares and is located in southeastern Romania, including the Danube Delta proper, lake complex Razim-Sinoe, Danube estuary to the Cotul Pisicii including floodplain Somova-Parcheş, Sărături-Murighiol lake and coastal and marine area between isobaths of 20 m (Fig. 1) (Creţu Romeo Cătălin, 2012). Reserve geographical position is defined by the following geographical coordinates: 28 ° 10'50 "(Cotul Pisicii) and 29 ° 42'45" (Sulina) east; 45 ° 27 '(Chilia, km 43) and 44 ° 20'40 "(Cape Midia) north.

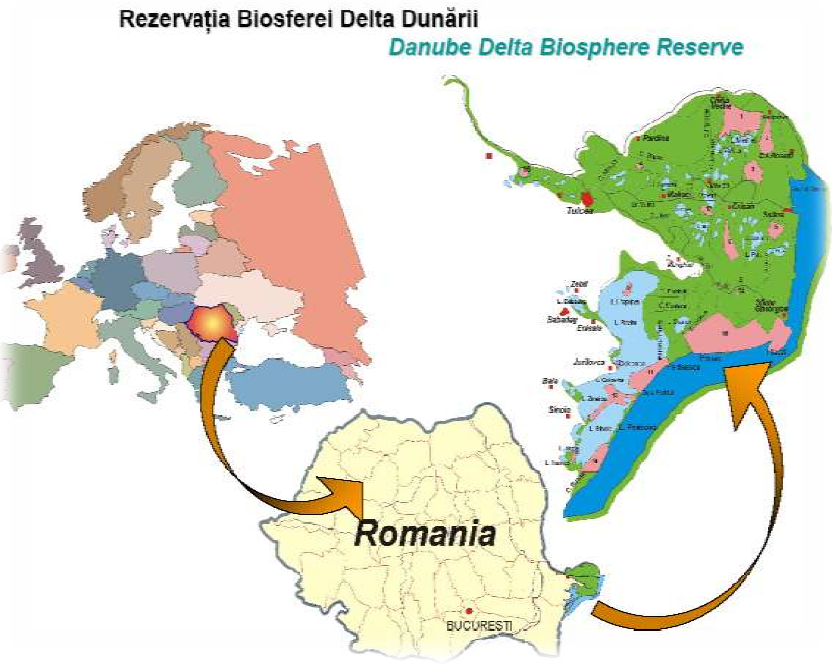

Fig 1: Danube Delta Biosphere Reserve - location

Of the total area of the site, more than half (312,440 ha) is the natural ecosystems of aquatic and terrestrial included in the list of areas with heritage value universal (Convention Natural Heritage UNESCO World) and those intended for ecological restoration areas that constitute public domain national interest. The rest of the dammed areas include areas for fishery, agriculture and forestry (80,000 hectares) under Law 18/1991 areas, including areas of land privately or publicly owned local interest in the towns or municipalities (about 29,000 hectares) and a marine buffer zone of about 103,000 hectares (Danube Delta Biosphere Reservation - "Report on the state of the environment in the Danube Delta Biosphere Reserve in 2014").

Danube Delta Biosphere Reserve on agricultural land represents a ratio of 12.9%, for a total of 61 453 ha. The area of 61 453 ha of agricultural land, 39 947 ha (64%) are dammed and drained agricultural areas within Danube Delta, 10,617 ha (17.3%) are dammed and drained agricultural premises located along Sf . George, the rest being the continental levees, levees shore of inland river system, river-marine and deltaic plain in flood-free regime (Alecu Ioan Niculae, Constantin Marian, 2006). The structure of agricultural land use, has the largest share of arable land (63%), followed by natural meadows (36.7%). The vineyards and orchards occupies significant private lands of the inhabitants.

The Research Method

As a research method we used in this study, the series of values ordered in relation to the succession of periods / moments of time, forming time series. It is the raw material, processed by statistical methods or specific econometrics, can highlight issues repeatable analogies conditioning benchmarks (Pecican Eugen Ștefan, 2007).

Characterization time series with seasonal component

A time series that contains seasonal effect is present:

$$y_t = y_{tT} + y_{tS} + y_{tR}$$

Seasonal variations can occur within a year or even a shorter period of time, such as month, week or day. To measure the seasonal effect can cause deviations seasonal seasonality indices.
Deviations seasonal measures the average deviations of each season the trend and take positive and negative values, so the amount deviations seasonal for all seasons to be zero (Philip Kotler, Gary Armstrong, John Saunders, Veronica Wong, 1998).
Seasonality indices measured on average, how often deviates variable, each season, the trend and have values above par or below par so that their product is equal to 1 (Merce, E., et. a., 2010).
To determine seasonal deviations follow ***the next steps***:
1. Remove the values of the time series (yt) trend component (y_{tT}) determined by the moving average method or by an analytical method.

$$y_t - y_{tT} = y_{tS} + y_{tR}$$

The Method of Moving Averages

It is used especially when fluctuations time series regular (seasonal or cyclical) to smooth evolution.
Long-term trend is determined as averages, calculated in so many words (m), how many there is a complete oscillation.

Mobile environments are called, sliding it permanently in calculating such average, leave out the first term of the previous average and placed next term.

If moving averages are calculated for example five terms, each term will include the adjusted value of the time, the two terms preceding and following two terms.

$$y_{tTMM} = \frac{y_{t-2} + y_{t-1} + y_t + y_{t+1} + y_{t+2}}{5}, \quad t = \overline{3, n-2}$$

In general, if the averages are calculated from (m) terms (m, odd number) will be lost by calculating averages (m-1) and each adjusted value terms will be located next to a value recorded.

If moving averages are calculated from (m) terms (m, even number), then the average values are between the real terms and will cross levels, thus adjusted by calculating the average of the averages.
2. For each season separately calculate the average results obtained in step 1. Thus, by averaging removes most of the residual variations. These averaged m seasons, measured differences versus trend line, given the seasonal component.

3. Seasonal deviations will be calculated from values obtained in the second step adjusted so that their sum is zero.

$$\left(\sum_{k=1}^{m} y_{Sk} = 0 \right)$$

To determine the seasonality indices, the methodology is similar, going through **the steps**:

a. Remove the trend component:

$$\frac{y_t}{y_{tT}} = y_{tS} \cdot y_{tR}$$

b. Calculate for each season, the average results from point 1, eliminating the residual variations.
c. seasonality indices are determined from averages obtained in step 2, adjusted so that the average index is equal to 1.

Results and Discussions

The most accurate results are obtained when using the geometric mean calculations. However, for ease of calculations, often using the arithmetic mean (Honţuş Adelaida Cristina, Toma Dinu Adrian, Beciu Silviu, 2015).

Once you determine deviations or indications seasonal seasonality seasonally adjusted time series will be [(y_t-y_{Sk}) misalignments and y_t/y_{Sk} indices]. The results thus obtained will contain only the secular trend component (y_{tT})and residual component (y_{tR}).

By deseasonalisation obtain: yt – ySk = ytT + ytR

or yt / ySk = ytT + ytR.

Determine the long-term trend, applying a mechanical method or analytical (Honţuş Adelaida Cristina, Tindeche Cristiana, Alina Marcuță, Marcuță Liviu, 2014).

In predicting phenomena affected by seasonality correct the trend forecasted levels:
- ✓ seasonal deviations;
- ✓ seasonality indices (***The seasonality of tourism activity).

After determining the deviation seasonal forecasting steps are:

a. For the series seasonally adjusted ($y_t - y_{Sk} = y_{tT} + y_{tR}$) to determine the trend (y_{tT}), using a mechanical method or assay.

b. For the next period, is projected trend component $y_{(n+p)T}$.

c. Gather the predicted values seasons with seasonal deviations (y_{Sk}) to obtain the final prediction:

$$y_{(n+p)} = y_{(n+p)T} + y_{Sk}$$

If the seasonal factor was measured by ***indices of seasonality***, then follow the next steps for forecasting:

a. For the series seasonally adjusted ($y_t / y_{Sk} = y_{tT} + y_{tR}$) to determine the trend (y_{tT}), using a mechanical method or assay.

b. For the next period, is projected trend component. $y_{(n+p)T}$.

c. Correct (by multiplication) values predicted by season, with hints of seasonality (y_{Sk}) to obtain the final prediction:

$$y_{(n+p)} = y_{(n+p)T} \cdot y_{Sk}$$

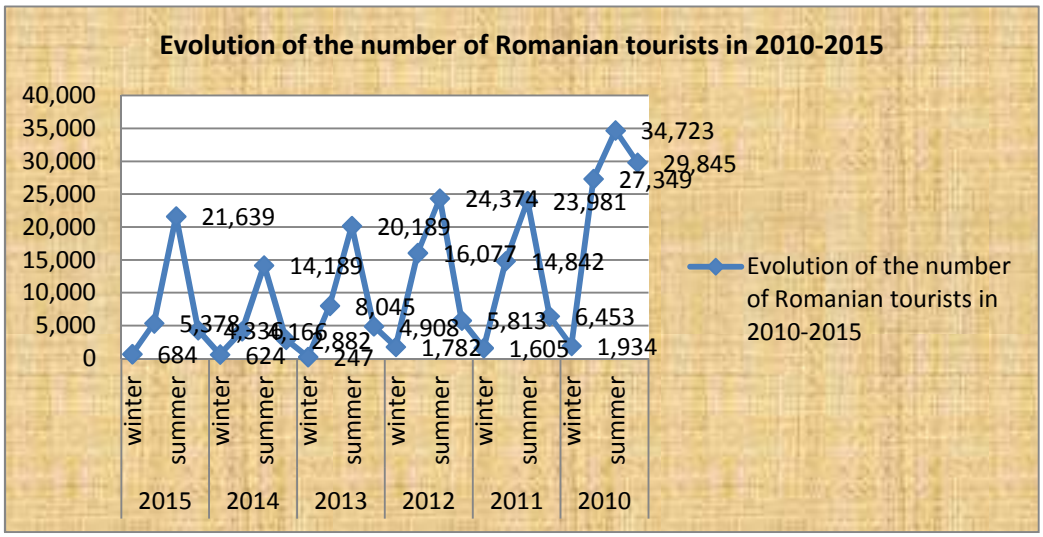
Conclusions

One of the problems which must cope managers of tourist reception, is the seasonality of tourism. The causes of seasonality can be natural (the seasons, weather conditions, variety and attractiveness of cultural values, frequency of events (fairs, festivals, etc., economical and organizational (structure of school and university, holiday schemes, increasing duration of free time and the redistribution of its habits , etc.

The analysis of data resulting projected a decline of Romanian tourists in the next two years on the 4 seasons / seasons, as follows:

Determine the Romanian forecast for the years 2016-2017 using seasonal indices.

Thus, in order to estimate the number of tourists in the Danube Delta region was use features seasonal component of time series method. This method was applied to a data series, representing the number of Romanian tourists who visited Delta in 2010-2015.



As can be seen from the graph above, the number of tourists visiting Delta is fluctuating depending on the season. Thus, the peak is reached in the summer season and winter season is recorded in a relatively small number of tourists. So we are dealing with a chronological series with seasonal effect. Also, in this graph we can see a downtrend in the number of tourists during the analyzed period. Such seasonal component of time series and trend component can be modeled as follows:

$$y_t = y_{tT} + y_{tS} + y_{tR}$$

Where: y_t - chronological number, the number of tourists in season (*t*)
y_{tT} - trend component of the time series
y_{tS} - seasonal component
y_{tR} - residual component,

yt - serie cronologica, numarul de turisti in anotimpul t
ytT – componenta de trend a seriei cronologice
YtS – componenta sezoniera
YtR – componenta reziduala

Our chronological series decomposition results in three components are presented in Table 6.

Table 6: Outlook for the Romanian tourists

Series chronological number of Romanian tourists	Trend	Seasonality + residue (seasonal deviations)	Seasonality + residue (seasonal indices)	Geometric Mean seasonality	Seasonal indices

Source: Own calculations

In the no 1 column, the trend component was calculated using the moving average method. In general, long-term trend (trend) is determined as averages, calculated in so many words (m), how many there is a complete oscillation (in our case, four terms as seasonal fluctuations occurs every four years). Being an even number of terms (four), mean values are between real terms, in which case we will cross levels, adjusted by computing environments.

$$y_{tTMM} = \frac{\frac{y_{t-2}}{2} + y_{t-1} + y_t + y_{t+1} + \frac{y_{t+2}}{2}}{4}$$

In the column number 2 is seasonal and the residual component calculated as the excess of the actual values and the trend component. $y_{tS} + y_{tR} = y_t - y_{tT}$

This method is used in our estimate if we use seasonal deviations.

If, however, embroider, seasonal indices, the seasonal component and the residual value is calculated as the ratio of relations and the trend component.

$y_{tS} + y_{tR} = \frac{y_t}{y_{tT}}$. Results are shown in column 3.

As a general rule, to measure the seasonal effect can cause deviations seasonal (measured on average deviations of each season the trend) or indices of seasonality (measured on average, how often deviates variable, each season, the trend) . Both methods are correct, just as in practice to not work with negative values are used usually estimate using seasonal indices.

In our estimates, we still use the seasonality indices. They have values above par or below par so that their product is equal to 1. So in columns 4 and 5 we calculated four indices of seasonality regarding each quarter, their media and their product geometry. Averaging each season it was done in order to eliminate residual variations. The table below geometric mean and the arithmetic was not chosen in order to obtain the most accurate results. It can be seen simply as their product is equal to 1.

Indices are below par levels below seasonal trend and seasonal indexes above unit are above trend levels. Such activity is recorded in peak summer months (with seasonal index value of 3.9188), while the lowest activity was recorded in the winter months, with seasonal index value of only 0.1619.

More specifically, seasonality indices thus obtained show that, on average, arrivals of tourists during the summer and fall is above long-term trend of 291.88% and 86.23%, while during the winter and spring; arrivals of tourists are below the trend line with 83.81% and 15.38%. As seen fluctuations in the number of tourists per season are very high.

Table 7: The final calculation for the number of Romanian tourists

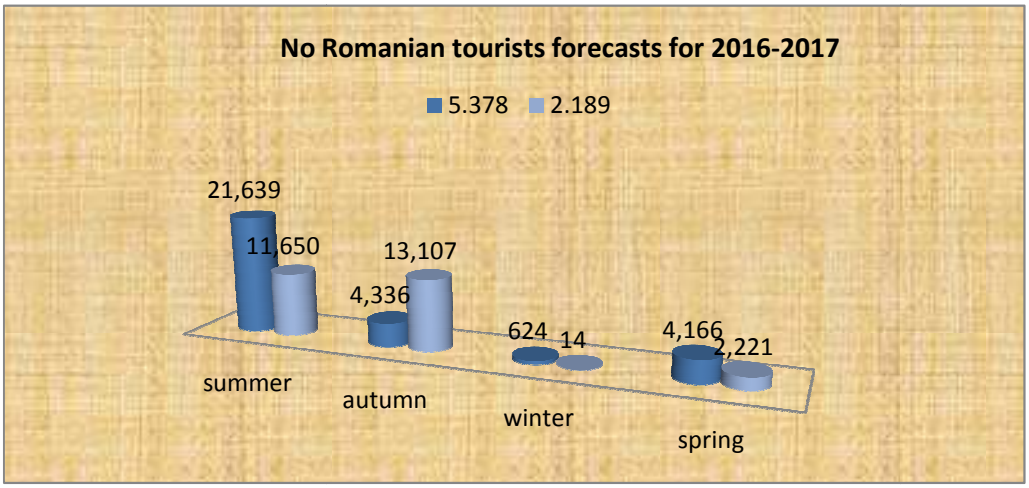
Source: Own calculations

Table no 7 using seasonal indices calculated in Table no 6, presents the results of their estimates on the number of Romanian tourists. Thus, in column number 6 are taken seasonal indices calculated in the previous step and column no. Seven series seasonally adjusted values are calculated as the ratio between the actual number of tourists related to a period (column 0) and seasonal index for the period (column 6). (Example: 29845 / 0.8462 = 35268).

Column number 9 shows the results of our own estimates for each period in the past (in order to test, validate their results by comparing their estimates with actual data) and our forecasters for future periods (next two years). The periods listed are numbered from 0 to 23, and the next period of 1 to 8 (column no 8). It specifies that the results thus obtained only contain long-term trend component. It was a decrease in the number of tourists as a general trend.

To take into account in our forecasts, and the phenomenon of seasonality, we corrected (by multiplication) levels predicted value indices seasonal trend, column No. 10 providing our final estimates on the number of Romanian tourists.



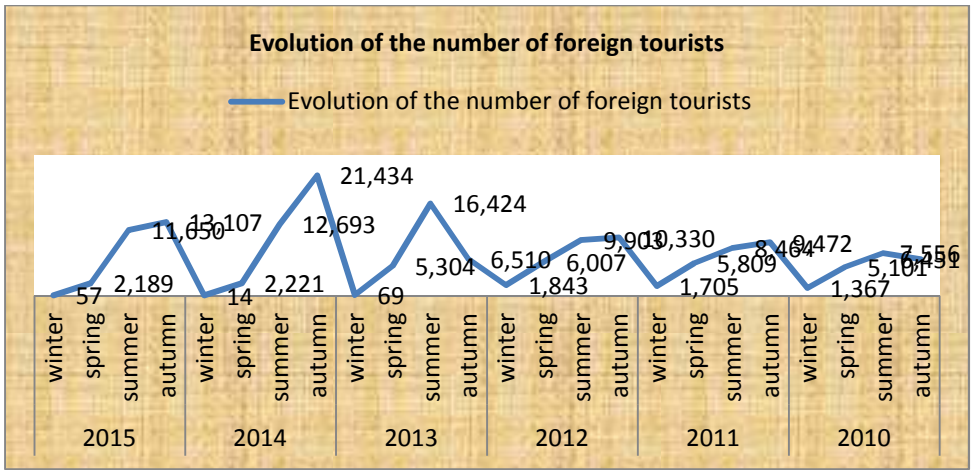
Forecasted data resulting from the analysis (mean) a decrease in the number of Romanian tourists in the next two years on the 4 seasons / seasons (table 8), as follows:

Table 8: Outlook final Romanian tourists

Season	year 2016	year 2017
Spring	28.703	24.134
Summer	127.629	106.471
The autumn	58.138	48.084
Winter	4.837	3.962

Source: Own calculations

And if foreign tourists, the trend is downwards, the situation is similar and presenting follows:



A feature of the series number of foreign tourists is fluctuation high from one period to another, which makes modeling this type of series you have to make value increased seasonal component and therefore a precision lower our estimates .

Table 9: Calculate the number of foreign tourists

Series chronological number of foreign tourists	Trend	Seasonality + residue	Seasonality + residue	Geometric Mean seasonality	Seasonal indices
0	**1**	**2**	**3**	**4**	**5**
57	5496	-395	0,9281	0,6600	**1,2631**

Source: Own calculations

As mentioned above, subunit seasonal indices represent levels below trend and seasonal indexes above unit are above trend levels. Thus, in this case all peak activity is recorded in the summer months (with seasonal index value of 3.0495), and the worst records all activity in the winter months, with seasonal index value of only 0.0883.

More specifically, seasonality indices thus obtained show that, on average, arrivals of tourists during the summer, fall, spring is above the long-term trend of 204.95%, 26.31%, and 123 respectively, 85%, and in the winter, arrivals of tourists are below the trend line of 91.17% (basically are almost nonexistent). Seasonal values of these indices come to confirm once more very large fluctuations in the number of foreign tourists from one period to another.

Table10: Outlook for the number of Romanian tourists

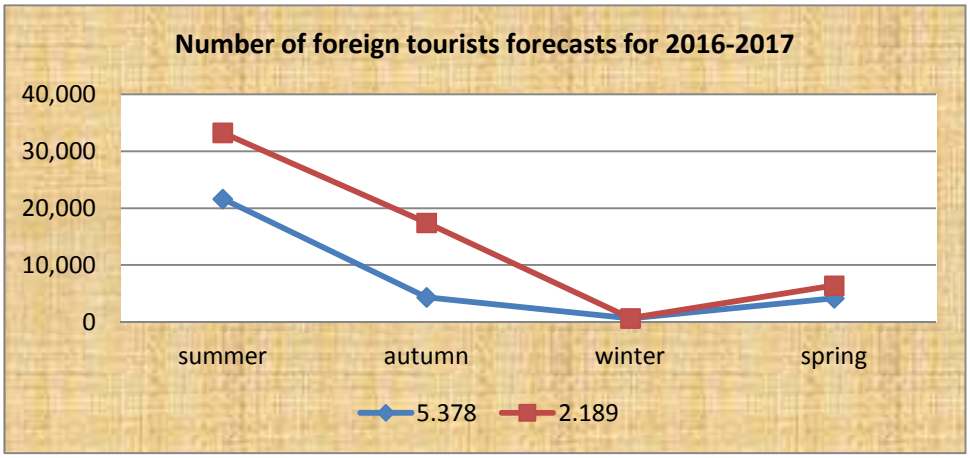
1,2631		7	1724	2177
0,0883		8	1656	146

Source: Own calculations



As can be seen from our estimates for the next two years, the number of foreign tourists will still be very small compared to the number of Romanian tourists and fluctuation from one period to another remain very high (even higher-season, but very small summer-fall) as in the case of Romanian tourists. Also, as in the case of Romanian tourists for the period 2016-2017 will see a decrease in the number of foreign tourists compared with the average of previous years.

Table 11: Final prediction number of foreign tourists

Season	Year 2016	Year 2017
Spring	6.253	5.641
Summer	6.284	5.462
The autumn	2.518	2.177
Winter	170	146

Source: Own calculations

The forecasts are worrying. The number of Romanian and foreign tourists will decrease compared with the average of previous years. To counteract this downtrend imposed a series of measures for the future: improving the quality of services provided, infrastructure development, improve

communications, increase quality of life, knowledge of the needs of tourists, which are constantly changing, the opportunities for European funds.

Abstract

The research results presented in this article refer to the implication of changing the non innovation or less innovative organizations in to innovative ones. Innovation is one of the most important characteristic for organizations worldwide in current market situation in a globalized economy. Globalization brings fierce competition and strict challenges with meeting the ever-increasing market and customer needs and expectations. Although everybody agrees that without innovation you cannot be competitive and you cannot exist on the market, there is still a resistance to change. Our aim with this research is to help managers to pas the initial resistance to innovation and to adopt innovation as a key element in their organizations. We have identified the main causes of organizational resistance to innovation and offered solutions to overpass this resistance. The results of the research can also be useful for future research and we consider that this part of innovation resistance aspects, both from customer and organization point of view, should be investigated more thoroughly.

Keywords: Innovation, change, resistance to innovation, change to innovation, organization resistance.

Introduction

The current business environment, in a globalized economy, demands new approach from organizations, in order to be competitive, profitable or event to resist on the market. In various studies, like in Maier (2015), the response to the new requirements is to consider innovation as a key element for organization, but innovation is not an easy thing, it requires some changes in the organization culture and there will be always some adversities to the changing process.

In the same time innovation is one of the most important factors behind the growth and prosperity of the global economy today but there is also an insufficient understanding of the innovation process. In Legardeur (2010) we can find that over the last century, industry leaders have learned to master the production process to such an extent that today it is not a significant competitive advantage. According to Maier (2014), the new challenge is to master the process of innovation - capitalizing change, creating new competitive advantages by offering better products by using better processes, providing better service or offering entirely new solutions.

A good innovation culture can generate innovations which are turn into significant advantages and big profits for the innovative organization and also can bring small outsiders in dominant position. In Olaru (2015) we see that he basic idea in case of successful innovations is to understand the customer needs and to develop the products and services that satisfy those needs. In the same time over time the unpredictable character of innovation led to a wealth of failed innovation projects.

According to Vlachaki (2010) the resistance to change is illustrated by some organizations that tend to developed themselves and to get used with what they do (basic skills) such that they get stuck there, and when the environment changes (ex. changing customer requirements, changing regulations) they are unable to adapt quickly and easily. We have oriented the research towards the innovative culture and focused on the resistance to innovation from organization. On the literature the

part, of the resistance to innovation is not well represented, there are few research oriented mainly on the customer resistance to innovation, like Bruce (2013).

2. Changing Behavior of Individuals in an Organization

Innovation is currently a subject of great interest for scientists and practitioners, who consider that the new way of creating prosperity is through innovation. Even if innovation is studied for a long time there is still not developed a comprehensive theory of innovation that can be applied in any field, in any condition and that can guarantee the success of the innovation process. History reveals that some innovations, which seems very big and important, became just a technical virtuosity and other ones with less or no expectation have turned into giant and profitable businesses.

In the beginning of the research we have focused on the individual resistance to innovation. Innovation implies little of bigger change, first from individual level and then from the hole organization. In the literature there are studies that deal with the process of transition and how people react to change. A good visual presentation of the process of transition through change is the transition curve processed by John Fisher. The transition curve is presented in figure 1.

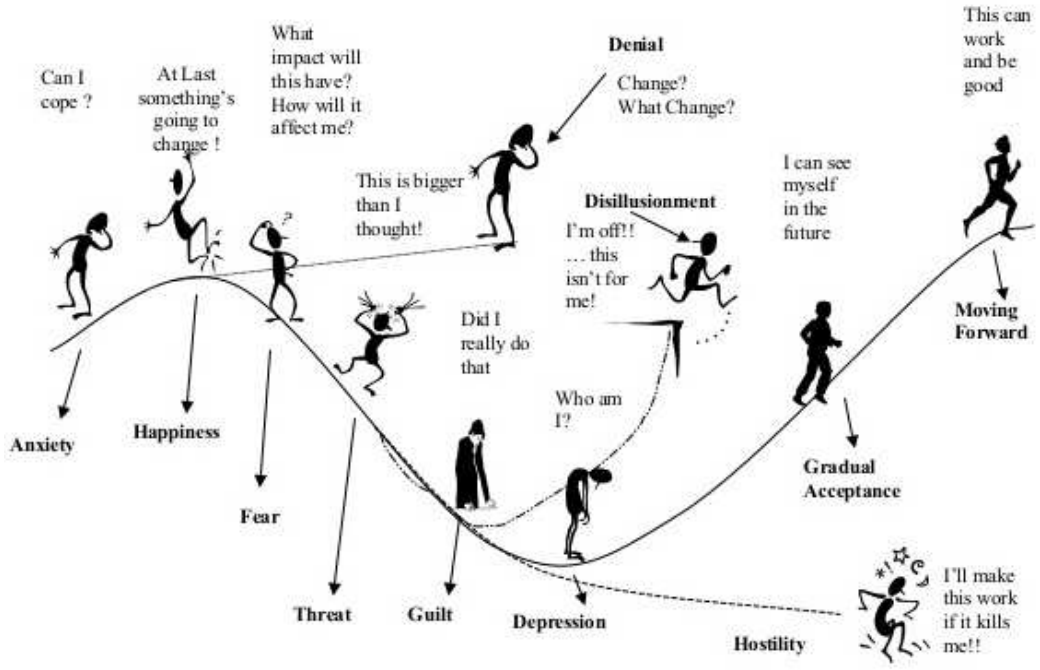

Fig 1. John Fisher's personal transition curve (Processed by author from *, 2016)**

As it can be observe there are a series of state through which a person passes, we will briefly present this stage according to Fisher. The first phase identified by Fisher is anxiety which appear, according to various specialists, when individuals cannot predict the future, is more like the fear of unknown. The second phase is happiness when something seem too happed, when a hope for a better perspective of the future appear. It is more like a dream phase, in some cases with high expectation and not necessary realistic ones.

The third phase is fear, this phase appear when the enthusiasm from the happiness phase begins to decrease and some little changes in the behavior occur, most of this changes are inevitable and they do not have a direct effect over situation, but they interpreted it like is a change that they also need to

do it. The fourth phase is the threat phase, this appear when the individual begins to realize that a change will happen, that he will be transformed, that the older choice must be changed.

Guilt is the fifth phase; this phase appears when the individual is aware of the past mistakes and realizes the inappropriateness of his previous actions and a sense of guilt develops inside him. From this phase the individual can pass to a phase of depression or to a phase of disillusionment or both. The phase of depression appears when individual sense a state of uncertainty over the future, over his ability to cope with new demands. In this phase there is a lack of motivation and confusion. In disillusionment phase the individual becomes unfocused, gradually withdraw his labor, unmotivated or even resign. This phase is associated with the period in which the goals, the beliefs and own values are different with those of the organization.

If the depression phase has a strong effect over the individual then is possible to pass to the hostility phase, when individual continue to operate processes proved to be failure and ignore the new processes. Another phase of rejection of change is the denial phase, defined by a lack of acceptance of any change and denies that there will be any impact on the individual.

As it can be seen from the transition curve there are also two phase that embrace the change, one is the phase of gradual acceptance and the other one is the moving forward phase. The gradual acceptance phase is the phase when the individual begin to make sense of his place within the change and he can see that he is going in a good direction, all this leads to an increasing level of self-confidence. In the moving forward phase the individual has more control, acts with more confidence, he is more positive and is starting to feel comfortable in this new situation.

The main conclusions from analyzing the transition curve are that in order to accept the change an individual must first understand the impact of the change on his construct system, any change regardless of size has an impact on the individual and generate a conflict between the existing knowledge and the anticipated ones. The role of managers is to find ways to transmit the needed information to every employee in order to understand the benefits of the change and to reduce the size of the conflict between new and old.

The acceptation of any change for individuals is not an easy thing because peoples act based on the previous experiences and those experiences can be positive ones, then the acceptation of change is easier to achieve, or they can be bad experience then is more likely to deny any future changes. Another interesting aspect is that a bad experience weighs much harder than a good experience in decision to accept of not the change, in the literature there is a ratio of 1 to 10 between bad experiences and good experiences.

3. Main Aspects that Led to Innovation Resistance

Innovation is a complex phenomenon, its success depends on a series of factors that cannot be controlled or exactly predicted. Innovation involves novelty, and to obtain novelty you should always force the limits. A very small percent of successful innovations came as a result of a genius idea; most of the innovations are the results of hard work performed during an innovation process. In order to have a successful innovation process a successful organizational innovation culture must exist to make possible to transform an idea into innovation.

The complexity of innovations leads to a series of different spectrum of responses to innovation; we have analyzed the aspects related with resistance to innovation. Fist types of innovations are those where there is no risk and no attempt to modify the existing habit. This type of innovation is considered as having a no resistance to innovations. But this type of innovations, with almost no risks is likely to transform the organization and have exponential growth.

The second type of innovations, when dealing with resistance to innovations, is those that have low risks but it involves some changes in the organizational culture of the company. As in case of first type of innovation adoption of the second type does not bring major profits or large growth for organizations. Another type of innovation is that involve high risks and changes in the organizational culture.

Innovation comprise in a number of activities that involve a certain degree of freedom for employees. This is more important in case of organizations that have a long period of existence on the market, their experience is formed by a certain way of dealing with employees, and the change to a different way is not always welcomed. By analyzing the individual perception to change and overlapping this resistance to change over the particularities of innovation we have identified some key aspects that influence the perception of innovation in an organization. In this research we have limited to the aspects that are in a manner controlled by every organization and we omitted the independent one, like the changing of the environment, the legislative change and so on.

A first aspect is related to the relation between the innovation resistance and the advantages of innovation. In this case the increase of innovation resistance is directly influenced by his advantages and disadvantages, the higher the perceived disadvantages the higher is the innovation resistance. Innovation is an unpredictable process and it is obvious that for any organization, no matter the size of it, in order to proceed in creating an innovation the advantages must overpass the disadvantages.

The perceived of risk associated with innovation is another aspect that influence the innovation resistance. For an organization when dealing with innovation it involve also adoption and acceptance of an existing risk, because the final result of an innovation is given by the client. This means that there is always the possibility of failure even if from the innovation process there are no major mistakes. The size of the risk that a company is willing to accept or it can handle influence the innovation resistance.

Another aspect that influences the innovation resistance for an organization is the complexity of the innovation process. It is known that in order to be a successful a innovation must be as much as simple possible. From organization point of view the higher the complexity of innovation the higher is its resistance to adopt it. The complexity of the innovation is given by two characteristics, the simplicity of the idea and the simplicity of execution, in this case it is important that this two characteristics to be as simple as possible in order to overcome the innovation resistance.

4. Overcoming the Innovation Resistance

As we saw in the previous chapters innovation is a very important characteristic of today's organizations. Although many organizations are aware of the importance of innovation in the current economic context, there is still a big innovation resistance among managers. Based on the above identified aspects, that influence the innovation resistance, we have formulated some key elements that every manager should consider in order to transform their organizations in to an innovative one and thus into a more competitive and profitable.

A first element is that the speed of adoption innovation will depend on the individuals self perception, other past experience and control position, and how these are combine to create the future perception of innovation. In this case managers need to be able to transmit clearly the advantages of every innovation process for the organization and in the end for each employee. Once the importance of innovation is well understood the innovation resistance will decrease.

The risk perceiving to innovation process is another aspect that need to be consider by managers. It is very hard and mostly impossible to eliminate any risk associated to innovation, as we said, innovation is a very hard to predict process, and the final results is influenced by a lots of factors and many of them cannot be controlled only by an organization. One of the possibilities to reduce the risk is to

transform the final result of the innovation in something with a high percent of the capability to be tried by the final customers, usually in form as a trial. This can be considering as the easiness on how customer can try the innovation before they adopt it.

Another element is related to the simplicity of innovation. Managers should consider that in case of innovation is better to have a simple idea and a easy way of achieve it. The process of finding a good and simple idea is not an easy one, it is important that within the organization to exist a good innovation culture. There are a lot of studies related to a successful innovation culture and its main characteristics therefore there should not be any problem for manager to adopt an innovative culture in their organizations.

5. Conclusions

Innovation, due to its complexity, is one of the most studied topics in the literature today. We consider that the results of our research are very useful both for practitioners and for scientists. This part of innovation, the part where aspects related to resistance to adopt, to begin or to receive innovation are analyzed, is poorly covered in the scientific literature. A solution for a less difficult and negative journey to a successful innovation is the positive view of the outcome.

We consider that this research results can be used as a base for future studies in this area, and that the part of the innovation resistance, from different points of view, is a topic that must be thoroughly examined due to its importance for organizations worldwide

Abstract

Subject Cataloging is one of the most crucial courses in the area of library and information management. This study aims to examine the students perception towards the cataloging subject which comprises of Subject Cataloging and Classification. The objectives of this study are to investigate the student's perception on cataloging tools while learning the subject. This study used quantitative research method by using a questionnaire as the data collection tool . The respondents are the third year students from the Bachelor of Library Management (BLM) program. It is important to investigate the student's perception in learning the cataloging subject due the weight given to this subject as core components in the BLM program . Subject Cataloging and Classification is a major heart of library science and information management in every institution. It is also critical to ensure that the students understand the subject matter and are well trained in using all the tools in-order to ensure all resources are systematically organized and classified. There are few technical parts of the cataloging area which considered challenging by the students. Hence, this research will determine the positive and the negative interpretation towards the subject cataloging and classification. The findings show that i) students moderately agreed with the adequateness of the cataloguing tools provided in their learning process. This research discuss several suggestions in the cataloging tools and the student motivation.

Keywords: Cataloging, Subject cataloging, Classification, Library science, Organizational Knowledge

Literature Review

Subject Cataloging is one of the most crucial courses in the area of library and information management. This study aims to examine the students perception towards the cataloging subject which comprises of Subject Cataloging and Classification. Teaching cataloging subject is now becoming more challenging than before. The technological and content advancements of digitalization, e-resources, review of AACR or introduction of Resource Description and Access (RDA), Functional Requirements for Bibliographic Records (FRBR) have shifted the whole process of teaching involved. The level of acceptance by the students and their perceptions on the subject would also be a good basis to be considered in the development of the teaching methods. Hence this research will seek to find out the student's perception towards cataloging subject through cataloging tools while learning the subject. It is known that subject cataloging requires best practices of teaching and learning approach. It requires students to be exposed to the basic theories of subject access to information as well as follow up with in class exercise and relevant assignments to ensure the theory is concrete (Taylor & Joudrey, 2002). Furthermore, to ensure the students are well understood about the subject cataloging, it is necessary for them to have some practical skill building exercise. Since there are limited studies conducted in this area thus, the picture on the student's feedback towards subject cataloging in university is not clear. This current research attempts to explore this matter by using student of public university as the subject of the study, the researchers attempt to describe how

the student's perception towards subject cataloging course influence their achievements and their cataloging skills as well. The results of the study will be limited only to the gathered data that is relevant to the objectives of the study, and this may be affected should students in different universities provide different feedback on the cataloging tools towards cataloging subject and lecturer's accountability in teaching subject cataloging. Owing to the constraints of the specific scope of study, this study was carried out in only one university. As a result, the findings will not accurately show the whole perceptions towards subject cataloging.

Cataloging Tools

In learning subject cataloging, Folashade (2014) point out that the learning facilities should be provided adequately to all students. It is a must for every student to learn and be able to use these facilities and tools. In the usage of DDC compared to LCC, Taylor (2009) claim that DDC have more difficulties in number building. While for subject heading LCSH are more complex than SLSH and MeSH (Taylor, 2009), In contrast Aina (2012) described LCSH and SLSH are both holding own complexity in assigning subject headings. There are hardly any researches that study the perceptions of the students towards learning the cataloging tools. For educators they also need to know the perception of the students in order to create a live full learning environment. Teaching cataloging subject is now becoming more challenging than before due to technological advancements and challenges of digitalization, e-resources, review of AACR or introduction of Resource Description and Access (RDA), Functional Requirements for Bibliographic Records (FRBR). Diverse geometrical growth in information resources poses challenge to librarianship (Bello & Mansor, 2011). The utilization of educational technology, especially computer-aided and web-based training, influences education design and development tremendously. Outcomes-based education and educational technology play a vital role in the design and development of training and have to be considered in such studies (Cloete, Snyman & Cronje, 2003). The level of acceptance by the students and their perceptions on the subject would also be a good basis to be considered in the development of the teaching methods. Hence this research will seek to find out the student's perception towards cataloging subject through three different areas; cataloging tools, lecturer's accountability, and the knowledge on cataloging towards cataloging subject.

Research Methodology

This study used quantitative methods for data gathering, a questionnaire set of 40 questions are distributed to 183 respondents. The respondents are students in third year and enrolled for the IML555 : Subject Cataloging and Classification .

Conceptual framework

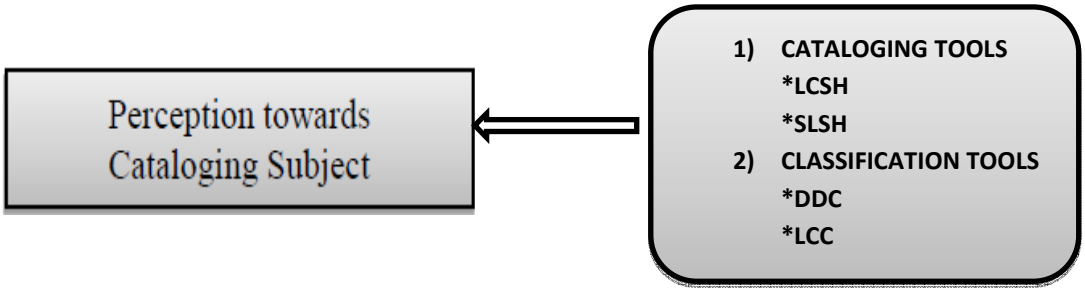

Diagram 1 : The above diagram shows the conceptual framework for this study, the dependent variable is Perception towards cataloging subject, while the independent variable are cataloging tools on cataloging and classification.

Findings

The findings of the study are reported in below tables and diagrams.

Student perception on the learning tools

a) The below table shows that subject heading learning tools such as (LCSH and SLSH) are moderately adequate for their learning in the classroom and lecturer.

Tools	Strongly disagree	Disagree	Moderate	Agree	Strongly Agree
LCSH	6 %	5.5 %	38.3 %	43.2 %	7.1 %
SLSH	4 %	6 %	44 %	41 %	6 %

Table 1: Adequateness of the Subject Heading learning tools

b) The below table shows that classification learning tools such as (DDC and LCC) are moderately adequate for their learning in the classroom and lecturer.

Tools	Strongly disagree	Disagree	Moderate	Agree	Strongly Agree
DDC	7.7 %	5.5 %	42.6 %	41.5 %	2.7 %
LCC	6.6 %	8.7 %	43.2 %	36.6 %	4.9 %

Table 2: Adequateness of the Classification learning tools

Based from Table 1 and Table 2, the study discovered that 43.2% agree that the LCSH tools are adequate for their learning process, and 43.7% rated moderate on the SLSH. Meanwhile, it was found that 42.6% rated moderate for the DDC tools are adequate for their learning proses and 43.2% of the respondents rated moderate for the LCC.

Analysis

Research Objective: to identify the student's perception on cataloging tools

Research Objective 1: to identify the student's perception on cataloging tools

Learning tools	Adequateness (%)
Library of Congress Subject Headings	50.3
Sears List Subject Headings	46.5
Dewey Decimal Classification	44.2
Library of Congress Classification	78.1

Table 7: Student's perception on cataloging tools

The Table 7 agree that the adequateness of cataloging tool is from LCC which is 78.1% , there is many copies for the students to get referred. Meanwhile the least adequateness is DDC which is 44.2% where the students need to utilize DDC tool in doing the technical works in a larger group. The other SLSH rated 46.5% meanwhile LCSH rated 50.3% of adequateness of the tool which they can utilize the tool in a very small group but still need to be shared.

Recommendation and Discussion

Based on the findings and discussions, this research would like to recommend the followings to the faculty and academicians. With respect to the nature of the subject, there are three main aspects in these recommendations which are:

i) Quantity of the learning tools including online tools

It need to be recommended that the organization learning have to upgrade the quantity of the learning tools including online tools. In order to measure the quality of the students in learning subject cataloging, it must be a total number of students reasonable with one set of cataloging tools used.

ii) Medium of Delivery

The medium of delivery should be attracted, harmonized, and enjoyful in learning technical topics of subject cataloging. It will recommend that the academicians to find another ways of method which will motivate the students interest towards this subject. Application of blended learning through mix method of traditional and online should be very attractive.

Conclusion

In conclusion, the study has been conducted for the purpose of investigating the perception towards Subject Cataloging in library science field. To accomplish this study, the researchers developed the framework which focuses of tools on cataloging and classification. In order to motivate and encourage for the cataloging knowledge, there should be full participation from all the cataloging academicians, faculty supports and libraries. These will definitely increase the success of knowledge sharing in library.

Turn Point for Social Marketing Advertising. A Case Study about Healthcare and Humor Shock Appeals

Gheorghe I.R., "Carol Davila" University of Medicine and Pharmacy, Bucharest, Romania, e-mail: raluca.i.gheorghe@gmail.com
Gheorghe C.M., "Carol Davila" University of Medicine and Pharmacy, Bucharest, Romania, e-mail: consuela2883@yahoo.com

Abstract

This paper aims to assess the effectiveness of a health care shock advertisement with humor appeals. A sample of 100 first year university students was selected, as they have the characteristics of Generation Y. Findings revealed that the vast majority of respondents placed the health care shock advertisement in the moral offensiveness category, followed by indecency and sexual references. Moreover, the vast majority of respondents considered the advertisement not interesting, some of them considered it funny, sad, humorous and even disgusting. There were no gender differences detected when a comparison was conducted in terms of delivered answers.

Keywords: health care advertising, humor, shock appeals, social marketing, emotions

Introduction

Social marketing has always been promoting behavioral change. A field which was almost captivated by the application of social marketing instruments was the health care. Social marketing specialists used to promote behavioral change through advertising and several other shock appeals such as shame and fear. However, many studies revealed that other appeals have to be employed as the ones already tested, failed to deliver the expected results.

One appeal which has a higher degree of success but not tested on health care services was humor. Humor was depicted as being able to trigger a higher chance of behavioral change.

In this paper, we investigate the effectiveness of a public health shock advertising with humor appeals. The advertisement was part of a campaign related to the vaccination against HPV. The objectives of the case study are:

- Using Dahl et al's (1997) classification of shock appeals, in which category the Romanian consumer would place the health care advertisement with humor appeals.
- What are the triggered emotions when seeing a public health care shock advertisement with humor appeals emphasized?
- Are there any differences between genders in the perception of humor in health care shock advertising?

Literature review

1. Social Marketing and Health Care Services

Since Kotler and Zaltman (1971) first mentioned the term, social marketing has become a continuous growing specialized field. From 2005 onward, considerable academic research focused on the definition and scope of social marketing (Helmig and Thaler, 2010). More exactly, scholars have defined what encompasses social marketing, what are the common points with commercial marketing, targeting and segmenting audiences as well as influencing behavioral change (Andreasen, 1994; Gordan, 2011). Nevertheless, specialists for an in-depth approach, offered several practical and theoretical frameworks to determine the effectiveness of social marketing (Helmig and Thaler, 2010; Lefebvre, 2011; Wymer, 2011).

The vast majority of social marketing case studies have concentrated on health promotion issues, such as smoking and tobacco prevention, disease control, physical activity, alcohol abuse and breast cancer (Dahl, 2010). Social marketing was also adopted in issues concerning injury prevention and environmental prevention (Cheng et al, 2011).

In public health, practitioners address the disadvantaged populations and the populations who have greater chances to improve their behaviors (Stead et al, 2006). Practitioners also faced difficulties in measuring the effectiveness of social marketing due to various external factors, as for instance, governmental regulation, media coverage and pricing (Andreasen, 2003). However, as the discipline matures and scales for measurement are narrowed and refined, it is essential for researchers to continue sharing and growing their expertise.

Health care is a service that *most people need but do not want*, in other words, it is an unwanted service. In addition, it can be considered highly troublesome but critically important for the welfare of any individual (Berry and Beaudapudi 2007).

Berry and Beaudapudi (2007) pointed out some important similarities and dissimilarities between health care and other services which, sometimes, it is necessary to be acknowledged by specialists.

The *similarities* mentioned are the following:

- The health care services are in essence intangible because a performance is actually being delivered during a health care consultation;
- Health care is a service which presents a considerable variability in physician performance and service delivery. The variability not only refers to changeable skills of physicians and service style but also in technical skills.
- Health care services are inseparable of the service provider mainly because it is a service that addresses the contribution of individuals. For a clear and accurate diagnosis, patients must be physically present where the service is delivered.
- Like most other services, health care is perishable. The health care organizations offer value through physician's knowledge, equipment and time but when these elements are in turn, not created, the value cannot be measured.
- Health care is a more technical service which requires knowledge when it is used. Customers not having the technical knowledge, transform health care in a *credence service*.

Although health care services are similar, in some aspects to other services, they also have *several dissimilarities*, as follows:

- *Consumers are sick*. Health care consumers are usually ill and arrive at the health care organizations with a combination of stress, pain, uncertainty, fear which make them more vulnerable, demanding, sensitive and more dependent on the service provider.
- *Consumers are reluctant*. When it comes to health care services, most consumers become reluctant regarding the issue because they consider the service "unwanted".
- *Consumers relinquish privacy*. Health care services are personal but not entirely private services.
- *Consumers need "whole person" services* meaning that an individual needs to be holistically and personally understood. As such, health care services require a high degree of customization to fit the needs and requirements of a patient's medical condition.
- *Consumers are at risk*. There is no other service more dangerous than health care. On one hand, it is designed to cure patients and on the other hand, harm occurs due to several reasons such as not giving the proper medication, communication errors, hospital infections, errors in diagnosis, and errors in treatment.
- *Clinicians are stressed*. Serving continuously ill individuals is an exceedingly stressful activity because of the physical intensity required and the emotional stress that sometimes is very hard to cope with.

As a consequence, in order to put all the pieces together, health communication through advertising became a core element which enables health care consumers and providers to manage the complex information demands on both sides (Kreps, 1990).

2. Humor in health care shock advertising

Today, advertising is found everywhere, making consumers indifferent to it. In order to attract them, specialists have invented *shockvertising*, which is a type of advertising but it deliberately violates norms with the intention to raise awareness about a public issue. However, rather than producing a favorable expected buzz, some sock appeals just produced embarrassment (Berger and Chen, 2014).
There were several definitions of shock advertising ranging from controversial advertising (Fam and Waller, 2003), offensive advertising (Phan and Prendergarst, 2001) to provocative advertising (Vezina and Paul, 1997). In this article, we use Dahl et al's (2003) classification of shock appeals in advertising. So, the classification encompasses disgusting images, sexual references, profanity or obscenity, vulgarity, indecency, moral offensiveness and religious taboos.

Many important health problems such as addiction to drugs, mental illness, and sexually transmitted diseases have long been recognized to induce feelings of shame (Cunningham et al, 2002). Since shame is considered an emotion which triggers withdrawal and avoidance and, at the same time, discourages people to seek help (Nathanson, 1992), it is highly challenging for specialists to conduct health prevention campaigns of such medical issues. Humor in advertising is an instrument used to help rethink the negative issues focused on health care and provides emotional uplift and increase self-efficacy (Bandura and Adams, 1977). Thus, it has been used as a possible advertisement strategy that may attenuate negative effects and increase the degree of acceptance of health care messages. Although humor has been observed in negative health contexts such as threat persuasion (Yoon and Tinkham, 2013) and fear appeals (Mukherjee and Dube, 2012), it has seldom been tested as a strategy for health campaigns. Because humor has the power to ease the communication in social marketing, it is imperative to test its consequences in public health campaigns.

In health care shock advertising, humor may be applied on two dimensions, depending on the content and the technique, respectively. A commonly used content typology places humor in aggressive, sexual and nonsense classifications. Technique typologies have also been employed in the shape of a pun, an understatement, a joke, something ludicrous, satire, irony and humorous intent (Weinberger and Gulas, 1992). Furthermore, Spotts et al (1997), identifies five different humorous types: comic wit, sentimental humor, satire, sentimental wit and full comedy. Also, Spotts et al (1997) described three humorous messages:

1. Humor dominant message presents the overall experience of an advertisement.
2. Message dominant
    - Information focused: Humor is suggested with the help of semantics, contains message arguments and requires a different processing perspective. If the humor elements is removed, the advertisement still makes sense.
    - Image-focused: humor in the advertisement is more visual and closely related to the target audience. If the humor is removed, the ad makes sense.
3. Structural and thematic messages

Moreover, in order to establish consistency with previous literature, Catanescu and Tom (2001) have defined five types of humor:

- Comparison: putting two or more elements together to produce a humorous situation.
- Personification: the attribution of human traits to animals, plants and objects.
- Exaggeration: overstating and magnifying something out of proportion.
- Pun: Using elements of language to create new meanings, which result in humor.
- Sarcasm illustrates blatant ironic responses or situations.
- Silliness: this type ranges from making funny faces to ludicrous situations similar to the one created in commercials.

- Surprise: includes all advertisements where humor arises from unexpected situations.

Weinberger and Gulas (1992) pointed out that the benefits of humor in advertising are:

- Humor attracts attention.
- Humor can increase retention of the advertising message.
- Credibility of the source can be assessed with humor.
- Attitude toward the advertisement can be assessed with the use of humor.
- The use of humor acts as a tool to distract the audience from making cognitive responses.

Further, Weinberger and Gulas (1992) stated that humor is not a magic tool which assures more successful advertising, however success is assured. In spite of the upsurge of humorous advertisements, it is important to understand that humor can be effective in some situations and not in others.

Materials and Methods

The case study describes an exploratory research with the aim of gaining more insight into the health shock advertising with humor appeals.

To determine the objectives, a self administered questionnaire was conceived. The first part of the questionnaire consisted of items related to the demographic profile of the respondents such as gender and age. The second part of the questionnaire encompassed items related to a print advertisement. The printed advertisement was part of an HPV prevention campaign conducted by one of the biggest Romanian private hospitals. The public health care campaign used humor appeals in order to attract attention and to trigger a behavioral change. We have selected this print because it used sarcasm and exaggerated appeals.

The sample was made up of first year students, as they have the characteristics of Generation Y and, according to some experts, they respond better to irony and humor (Wolburg and Pokieyeczynski, 2001). Moreover, targeting university students has been a research practice for many years because they represent a homogenous group (Tinkham and Weaver-Larisey, 2004). As such, the sample consisted of 100 students with the ages between 20 and 25. This is a typical age which experts in shock advertising want to influence (Vezina and Paul, 1997).

Data was collected and analyzed using SPSS version 10. For the comparison between the respondents' genders in answering the items included in the questionnaire, we employed the Chi-square test.

Findings

a) Demographic profile
   - The mean age of the respondents was 20;
   - There were 66.7% female respondents and 33.3% male respondents.

b) Questionnaire findings

In accordance with Dahl et al's classification, more than 40% of the respondents placed the humorous shock advertisement in the moral offensiveness category, followed by sexual references and indecency (figure 1).

The respondents, when visualizing the health care shock advertisement considered it not interesting, funny, disgusting, sad and humorous. Other emotions reveled were guilt, irritation, silliness, optimism and hope (figure 2).

Using the Chi-square test, we could not find any significant differences between the answers given by the female respondents and the male respondents.

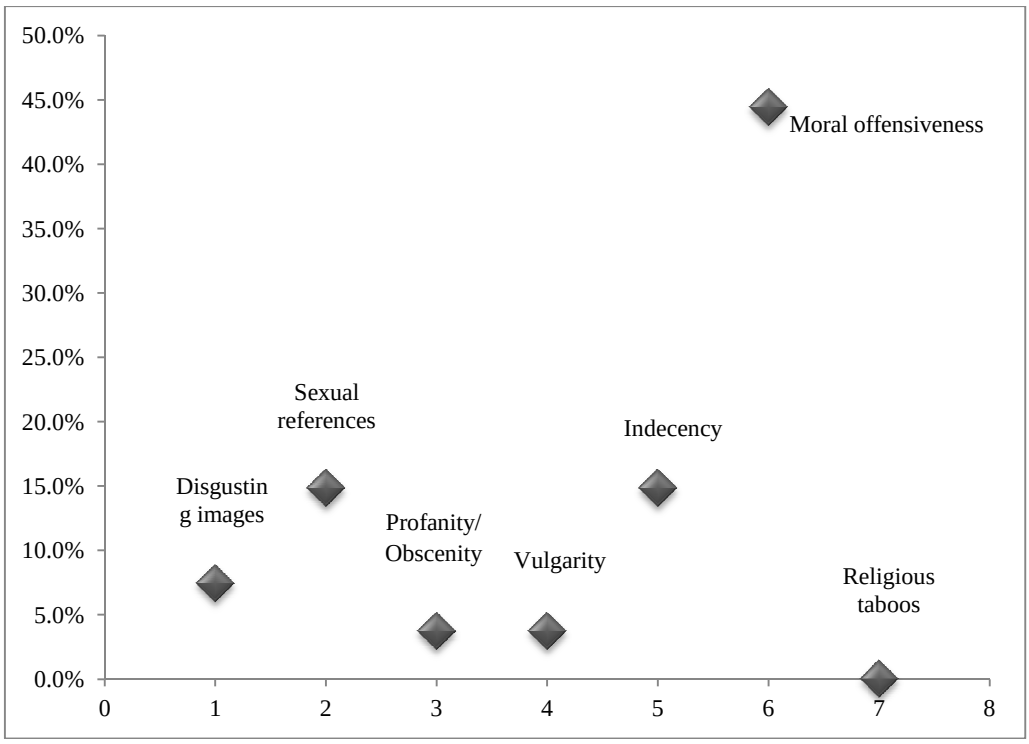

Fig 1. Respondents' categorization of the health care shock advertisement with humor appeals using Dahl et al's classification

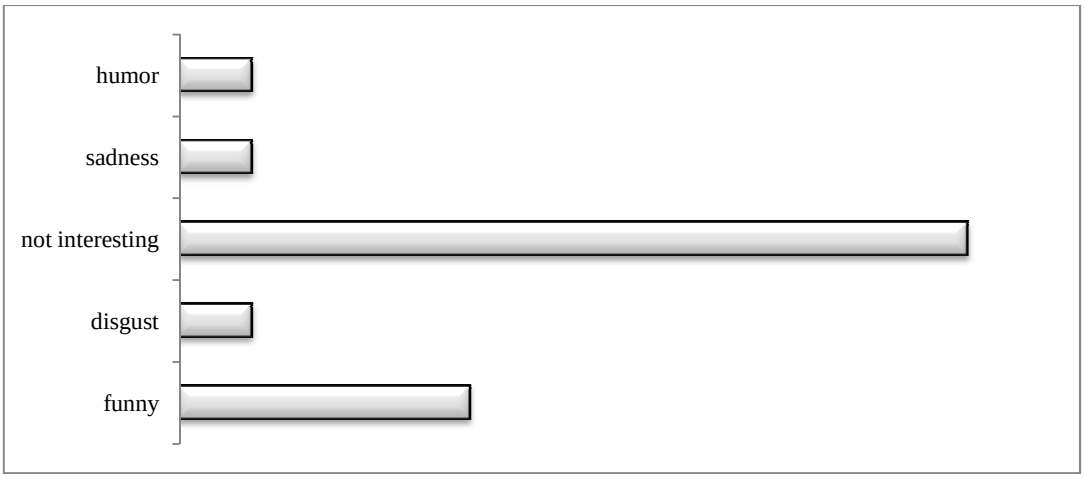

Fig 2. Emotions revealed by the respondents when visualizing the health care shock advertisement with humorous appeals

Discussion

The research outcomes revealed that, even if, in some cases humor is the key to success, in our case, it was not. Still, while the use of humor in advertising is high, the efficacy of humor as a communication appeal, in some fields, remains uncertain. As pointed out by several other studies, the impact of humor in advertising has proven to be rather elusive, dividing experts in two groups, one praising and supporting the effectiveness of humor appeals in advertising, and one decrying its employment.

Several studies on humor in advertising have been conducted over the past 25 years, but understanding the impact of humor has been extremely difficult (Weinberger and Gulas, 1992). Furthermore, Fatt and Poon (2002) argue that studies on the effectiveness of humor advertisements have produced mixed results. 64% of advertising specialists believe that humor has no effect or has a harmful effect on the message's understanding. As a consequence, it was concluded that the humorous message in advertising, is influenced by the nature of the social marketing cause promoted, the audience's characteristics, the communication appeals, the humor style, the humor relatedness and humor placement (Spotts, Wienberger and Parsons, 1997). All these factors should be taken into account for further research objectives with a special interest in health care shock advertisements.

Descriptive Study on Demographic Characteristics and Bank Selection Criteria among Undergraduate Students in Malaysia

Shafie Mohamed Zabri[a], Kamilah Ahmad[b], Wong Yew Wah[c]
[a,b,c]Faculty of Technology Management and Business
Tun Hussein Onn University of Malaysia
[a]shafie@uthm.edu.my, [b]kamilah@uthm.edu.my, [c]ap120456.siswa@uthm.edu.my

Abstract

In Malaysia, there were 27 commercial banks, 16 Islamic banks and 12 investment banks, which provided financial services to the customers. Previous literatures showed that there were some similar and differences in bank selection criteria among undergraduate students. In this study, market failure and unprofitable banking business in Malaysia's banking industry was identified as one of the issues that alarming in banking sector. Thus, the purpose of this study was to identify the bank selection criteria among undergraduate students and the relationship between demographic characteristics and bank selection criteria. The bank selection criteria used in this study included (1) Convenience; (2) Financial benefits; (3) Bank reputation; (4) Technology-based services; and (5) Corporal efficiency. This study is a descriptive study which focuses on quantitative approach. A structred questionnaire was distributed to 375 respondent during September to November. However, only 320 questionnaire were returmed and valid for data analysis. Likert scale, frequency analysis and cross-tabulation analysis were used to analyzed the quantitative data. Findings shows that undergraduate students view the availability of 24 hour ATM services; high speed of transaction; financial stability of bank; highly confidentiality customer record; and good security management as the most importance criteria when selecting a bank. Furthermore, findings also indicated that there were some difference in bank selection criteria with respect to gender; age group; ethnic group; field of study and household income level. This findings contributed an overview of bank selection criteria among undergraduate students in Malaysia for banks to provide more appropriate marketing strategies to attract this market segement.

Keywords : *Bank selection criteria, Demographic characteristics, Undergraduate Students, Cross-tabulation*

1.0 Introduction

Customers are exposed to diverse choices and more concerned about the value for their money (Saleh *et al*., 2013). Rao & Sharma (2010), indicated that customers' bank selection dynamics have been given attention by many researchers and bank marketers in order to identify the appropriate marketing strategies. The traditional belief that only businesses and wage earning customers will bring income to the bank is now becoming inconsequent as students market was expanding in nowadays (Kaynak & Harcar, 2005). According Sufian (2007) and Institute Bank Malaysia (2015), the Malaysian financial system can be structured into two components, (1) Banking System and (2) Non-bank Financial Intermediaries. As indicated by Mokhlis, Salleh & Mat (2011), increasing levels of competition in Malaysian financial market has increased the need for banks to attract the new market segments. Previous literatures indicated that university students became a target market as a source of new accounts and future profitability in banking industry (Khaitbaeva *et al*., 2014).

Despite majority of the university students are umployed and "earning" comes mainly from education loan and parent contributions, however, they have become an important consumer market segment recently. In Malaysia, Bank Negara Malaysia (2009) indicated that the decrease in profitability of bank institutions had cause retail bank to merge into 22 commercial banks by 2009 from an initial 54 individual retail banks. As an evidence, Standard Chartered bank had cut and relieved 4000 staff in 2015 as a cost-cutting initiative (Mathew, 2015). Furthermore, previous literature also indicated that university students have represented a critically important market for bank marketers in recent years

(Chigamba & Fatoki, 2011; Khaitbaeva *et al.* 2014). However, many scholars indicated that the potential of undergraduate student segment as a customer has received lesser attention in the context of banking (Rao & Sharma, 2010; Singh, 2014). Rao & Sharma (2010) and Makhlis *et al*. (2011) added that although the previous findings have been conducted and made a significant contribution to the literature on bank selection criteria. However, a set of determinant variables may not be applicable to other countries due to the differences in culture, political, economic and legal environment (Almossawi, 2001; Makhlis *et al*., 2011). Therefore, market failures and unprofitable banking business in Malaysia was identified as one of the issue that alarming the finance institutions, government and other shareholders of banking sector.

This study was carried out with the aims to identify the bank selection criteria among undergraduate students in Malaysia and also to investigate the relationship between demographic characteristic and bank selection criteria of students in UTHM. Respondents of this study only focusing on undergraduate students who enrolled a range of degree courses in UTHM. A sample of 375 undergraduate students in UTHM was selected randomly in this study. This study is worth to be carried out in order to benefits the bank marketers to understand undergraduate students' bank selection criteria in Malaysia. In addition to this, it can be act as references and new knowledge contribution for advanced research in academics which related to this topic.

2.0 Literature Review

2.1 Bank Selection Criteria Variables

Previous literatures shows that there were plenty of studies have been conducted regards on the bank selection criteria in Europe, Africa and Asian countries. However, Mokhlis *et al*. (2008) indicated that there is no single agreement in choosing appropriate variables in bank selection criteria, and this is mostly related to banking behavior, intention, and attitude of customers. In this study, the chosen variables were adapted from Mokhlis *et al*. (2011). Therefore, this study suggests that (1) Convenience; (2) Financial benefits; (3) Bank Reputation; (4) Technology-based services; and (5) Corporal efficiency which consisted of 25 different attributes were considered to be very supportive variables for bank selection decision. These variables were used in order to study the relationship between demographic characteristics and bank selection criteria among undergraduate, as illustrated in **Figure 1** and briefly elaborated in the following subsections.

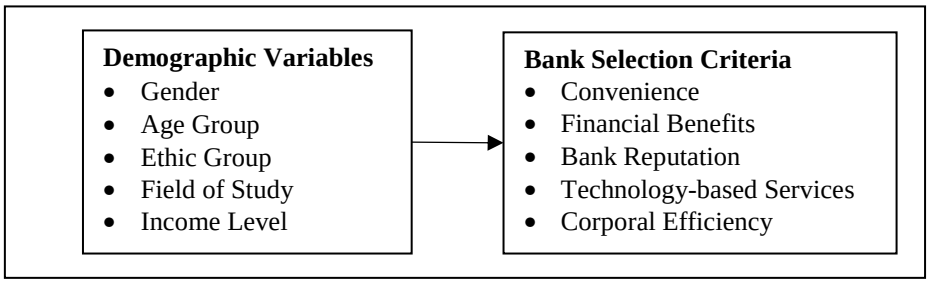

Figure 1: Bank Selection Criteria

2.1.1 Convenience

Rahid & Hassan (2009); Mokhlis *et al*. (2011) and Khaitbaeva *et al* (2014) defined convenience as location convenience, sufficient transaction time, strong global and local network. In this study, convenience in selecting a bank included (1) proximity of bank branch location to univesity; (2) the availability of parking facilities; (3) availability of ATM services in several locations; and (4) global branch network.

2.1.2 Financial Benefits

Financial benefits refers to the favorable loan experience, rate of return, cost of services, bank charge, ease of account opening procedure and free gifts for customers (Rahid & Hassan, 2009; Chigamba & Fatoki, 2011; Mokhlis *et al*., 2011).

2.1.3 Bank Reputation

Bank reputation refers to a bank which has a good brand name and good security management in order to provide perceived confidentiality to the bank customers (Rahid & Hassan, 2009; Holstius & Kaynak, 1995; Saleh *et al*., 2013).

2.1.4 Technology-based Services

According to Mokhlis (2009) and Khaitbaeva *et al*. (2014), technology-based services refers to the availability of 24 hours ATM services, mordern technology that used, internet bankig or mobile banking services. It also used to explain how fast a transaction can be done.

2.1.5 Corporal Efficiency

According to Rahid & Hassan (2009); Abduh & Ornar (2012) and Khaitbaeva *et al*. (2014), corporal efficiency refers to efficient managers, faster transaction and document processing, friendliness of bank personnel, responsiveness staff and employees attire apprearance.

2.2 The Relationship between Demographic Characteristics and Bank Selection Criteria

Previous studies indicated that there were some similarities and difference findings in bank selection criteria based on demographics charateristics (Safakli, 2007; Mokhlis *et al*., 2008; Rahid & Hassan, 2009; Mokhlis *et al.*, 2011). Customer's bank choices were also affected by demographic variables Denton & Chan (1991). In order to achived the second research objective, respondents were categorized according to four different demographic characteristics which consist of (1) Gender, (2) Age group, (3) Ethnic group, (4) Field of studies, and (5) Income level.

3.0 Research Methodology

This study is a descriptive study which focuses on quantitative approach. Questionnaire was used as instrument to identify the bank selection criteria and to gather the data. As indicated by Churchill & Lacobucci (2002) and Mattila (2003), descriptive analysis was chosen in order to identify and explain variables that exist in a given situation. In addition to this, it also attempts to describe the relationship that exists between these variables in order to provide a picture of a particular phenomenon (Churchill & Lacobucci, 2002; Mattila, 2003).

A three part structured questionnaire survey was used as instrument to collect the measurable data from the respondents.The first part asked about the demographic variables such as (1) Gender; (2) Age group; (3) Ethnic group; (4) Field of studies; and (5) Income level. The second part were regarding the five bank selection criteria: (1) Convenience; (2) Financial benefits; (3) Bank reputation and image; (4) Technology-based services; (5) and Corporal efficiency) which consisted of 26 different attributes. The final part of the questionnaire was established to obtain information on the banking behavior of the respondents. These included name of the banks at which savings accounts were maintained, length of time that respondents have been with their banks and so on.

According to International Colleges and Universities Net (2015), the whole population of students who enrolled at UTHM is estimated at 14,999 students in 2015. For the purpose of this study, undergraduate students of UTHM were taken as the sample of study due to each of them have a bank account and adequate to represent the population. According to Krejcie and Morgan (1970), the recommended sample size is 375 respondents of the population. Thus, a total of 375 questionnaires were distributed to the undergraduate students at different faculties, library and bus stop during

September to November, 2015. However, only 320 questionnaires were returned and used for data analysis.

4.0 Data Analysis and Results

In this study, Statistical Package for Social Science (SPSS) was used to analyze and interpret the quantitative data. The analysis adopted in this study were decriptive data analysis. The five point Likert scale ranging from 1 (not important at all) to 5 (very important) was used to rate the importance of each of the bank selection criteria among the undergraduate students. Furthermore, cross tabulation was used to explain the relationship that exists between demographic characteristics (gender, age group, ethnic group, field of studies, and income level) and bank selection criteria. As indicated by Mahat & Ali (2012), the mean score computed from the respondents were used to weight the bank selection criteria, while cross tabulation was used to explain the relationship between bank selection criteria and demographic characteristics. In this study, *n* represent the sample size of undergraduate students

4.1 Demographic Profile of the Respondents

Table 1 indicated the demographic charateristics of the respondents. Findings shows that majority of the account holders in this study were female (*n*= 164, 51%) and most of them were 4th year undergraduate students (*n*=108, 33.8%). The largest group of respondents came from aged 22 to 24 years old which account 157 or 49%. Results shows that 59.1% (*n*=189) were Malay respondent, while Chinese and Indian account 33.8 % (*n*=108) and 7.2% (*n*=23) respectively. Apart from that, findings indicated that respondents were more likely to select Bank Muamalat (*n*=100, 31.3%) due to the requirement of PTPTN loan. As indicated by Hinson, Osarenkhoe & Okoe (2013), bank accounts are needed because students' loans and bursaries were disbursed directly though student's bank accounts.

In addition to this, majority of the respodents were non-engineering students (*n*=164, 51%) and 156 or 49% of the respondents were engineering students. 58.8% (*n*=188) of the respondents were with RM 1,001 to RM 3,000 monthly household income, followed by RM 3,001 to RM 5,000 (*n*=73, 22.8%) and above RM 5,000 (*n*=35, 10.9%). This shows that majority of them were from middle-class group.

Table 1: Demographic Characteristics of the Respondents

Demographic Characteristics	*n*	%
(1) Gender		
Male	156	51.0
Female	164	49.0
(2) Enrolment		
1st year	76	23.8
2nd year	85	26.6
3rd year	51	15.9
4th year	108	33.8
(3) Age Group		
19-21	128	40.0
22-24	157	49.0
>25	35	11.0
(4) Ethnic group		
Malay	189	59.1
Chinese	108	33.8
India	23	7.2
(5) Bank Selected		

Maybank	88	27.5
CIMB	58	18.1
BSN	34	10.6
Public Bank	40	12.5
Bank Muamalat	100	31.3
(6) Field of Studies		
Engineering (FKMP, FKEE, FKAAS, FTK)	156	49.0
Non- Engineering (FPTV, FSKTM, FPTPT, FSTPi)	164	51.0
(7) Monthly Household Income		
<RM 1,000	24	7.5
RM 1,001 – RM 3,000	188	58.8
RM 3,001 – RM 5,000	73	22.8
>RM 5,000	35	10.9

4.2 Respondents' Banking Behavior

Table 2 indicated the banking behavior of the respodents in this study. Finding shows that 62.5% (*n*=200) of the respondents have their source of money come from PTPTN followed by parent as the source of money (*n*=86, 26.9%) and working as source of money (*n*=34, 10.6%). This is because a bank account needed for student's loan (PTPTN), bursaries and salaries purpose (Osarenkhoe & Okoe, 2013). In terms of type of bank accounts, 77.8 % (*n*=249) of the respondents operating only saving accounts with their respective banks, another 19.7 % *(n*=63) operate only current accounts. The remaining 2.5% (*n*=8) operate deposit accounts. Rao & Sharma (2010) explained that undergraduate students do not open an account for only for saving money but also want other services such as PTPTN loan.

Majority of the respondents have active account with 1 to 3 years (*n*=249, 77.8%) followed by respondents who have active account more than 6 years (*n*=98, 30.6%), only 5% or 16 of the respondents have active account less than one year. Result also shows that most of the respondents updating their account less than five times (*n*=153, 47.8%) annually. Those within 5 to 10 times and 11 to 15 times annually have about 28.1% (*n*=90) and 15.3% (*n*=49) respectively, while updating account with more than 15 times annually account for 8.8% (*n*=28). This indicated that respondents' bank account were updated and active.

Besides that, results indicated that 69.1% or 221 out of 320 respondents use the Internet banking to perform their banking activities such as check for account balance (23, 10.4 %), bills payment (86, 38.9 %), and transfer money between account (112, 50.7 %). Meanwhile, only 99 or 30.9 % respondents do not access to the Internet banking services when deal with their bank transaction.

Table 2: Banking Behavior

Variables	***n***	**%**
(1) Source of Money		
Parent	86	26.9
Working	34	10.6
PTPTN	200	62.5
(2) Types of Bank Account		
Current account	63	19.7
Saving account	249	77.8
Deposit account	8	2.5
(3) Active Account		
Less than 1 years	16	5.0
1-3 years	142	44.4

4-6 years	64	20.0
> 6 years	98	30.6
(4) Updating Frequency (annually)		
Less than 5 times	153	47.8
5-10 times	90	28.1
11-15 times	49	15.3
> 15 times	28	8.8
(5) Internet Banking Activities		
Check account balance	23	10.4
Bills payments	86	38.9
Transfer money	112	50.7

4.3 Respondents' Bank Selection Criteria

4.3.1 Convenience

In terms of convenience criteria, findings indicated that the availability of ATM services in several locations (mean=4.14), bank with global branch network (mean=3.92) and the availability of parking space near the bank (mean=3.81) were mentioned as importance determinants of bank selection decision among the undergraduate students. However,proximity of bank location to university scores the lowest priority with mean value of 3.71 This result is consistent with previous studies which done by Shevlin & Graeber (2001) and Rao & Sharma (2010) who claimed that ATM services was a determinant of intention to select a bank due to easy accessibility to their bank accounts and save time.

4.3.2 Financial Benefits

The mean value for high rate of return on saving account which account 3.99, low service charges (mean=3.96) and high interest rates on deposit (mean=3.75) shows the most important determinant criteria of bank selection decisions when selecting a bank. However, the respondents give less attention to the variables such as financial services counseling that provided by bank staff (mean=3.73) and the availability of obtaining credit card (mean=3.46) when they select a bank.As supported by Rao & Sharma (2010) and Mokhlis, Salleh & Mat (2011), economic factors such as interest rates on deposit and monthly charges weigh heavily on students' bank selection decisions because their want assurance of the services from the bank.

4.3.3 Bank Reputation

In terms of bank reputation criteria, financial stability of bank which account 4.42, the confidentiality of bank customer record which have mean value of 4.34, good security management (mean=4.33) and safety of fund (mean=4.28) also shows the vital determinant criteria that influenced undergraduate students' bank selection. Rao & Sharma (2010) explained that undergraduate students were more likely to have accounts in renowned banks and good security arrangement to assured safety of their money. Besides that, this also reflects respondents' desire of banking with a stable bank and assurance of confidentiality of customer record when dealing with their transaction (Ukenna & Monanu, 2012).

4.3.4 Technology-based Services

Results revealed that the availability of 24 hours ATM services (mean=4.50), high speed of transaction (mean=4.46), and the availability of mobile banking services (mean=4.29) has a strong influence on respondents' decisions compared to online bill payment (mean=4.13) and internet banking facility (mean=4.08) when selecting a bank.Selamat & Abdul-Kadir (2012) explained that the provision of higher transaction speed was in line with the product and services that provided by the bank. Selamat & Abdul-Kadir (2012) added that most of the banks were offering mostly similar

products such as PTPTN loan, saving deposit and other. Therefore, how fast and efficient the service they can serve in attaining competitive advantages became a key difference between two banks (Selamat & Abdul-Kadir, 2012).

4.3.5 Corporal Efficiency

Findings shows that helpful and efficient staff (mean=4.32), knowledgeable and skill staff (mean=4.29), staff responsiveness (mean=4.26), staff politeness (mean=4.21) and friendliness of bank personnel (mean=4.08) were attach importance to the criteria of bank selection decisions among undergraduate students. This indicated that better social interaction between banker and undergraduate students are gaining prominence due to the influence of Asian culture (Rao & Sharma, 2010).

4.4 The Significant of Bank Selection Criteria

Table 3:Ranking Importance of Different Variables related to Bank Selection Criteria

No	Variables	Mean	Importance Rank
1	Availability of 24 hours ATM services	4.50	1
2	High speed of transaction	4.46	2
3	Financial stability of bank	4.42	3
4	Confidentiality of bank customer record	4.34	4
5	Good security management	4.33	5
6	Helpful and efficient staff	4.32	6
7	Availability of mobile banking services	4.29	7
8	Knowledgeable and skill staff	4.29	7
9	Safety of fund	4.28	8
10	Staff responsiveness	4.26	9
11	Staff politeness	4.21	10
12	Availability of ATM services in several locations	4.14	11
13	Online bills payment	4.13	12
14	Internet banking facility	4.08	13
15	Friendliness of staff	4.08	13
16	High rate of return on saving accounts	3.99	14
17	Good brand name	3.97	15
18	Low service charges	3.96	16
19	Global branch network	3.92	17
20	Employees attire appearance	3.91	18
21	Availability of parking facilities	3.81	19
22	High interest rates on deposit	3.75	20
23	Financial services counseling	3.73	21
24	Proximity of bank location to university	3.71	22
25	Availability of obtaining credit card	3.46	23

As shown in **Table 3**, it presented a summary in the relative importance of choice criteria in respect of selecting a bank among undergraduate students. In this study, there were 25 different attributes extracted from (1) Convenience; (2) Financial benefits; (3) Bank reputation; (4) Technology-based serviced; and (5) Corporal efficiency criteria. Findings revealed that the availability of 24 hours ATM services (mean=4.50); high speed of transaction (mean=4.46); financial stability of bank (mean=4.42); confidentiality of bank customer record (mean=4.34); and good security of management (4.33) ranked as the top five bank selection decisions among the undergraduate students.

This can be concluded that undergraduate students were more emphasised on technology-based services (mean=4.31) and reputation of the bank (mean=4.25) compared to corporal effciency (4.23), convenience (mean=4.05) and financial benefits (mean=3.83). Mokhlis *et al*. (2011) explained that this is because undergraduate students were more reliance on modern technology and conscious of every aspect of their banks for the best deal.

4.5 The Relationship of Demographic difference and Bank Selection Criteria

4.5.1 Gender and Bank Selection Criteria

Table 4 shows that the availability of 24 hours ATM services, high speed of transaction and financial stability of bank have a great influence in bank selection decision among male and female respondents. However, male respondents (mean=4.36) view confidentiality of bank customer record more important criteria compare to female respondents (mean=4.32). This result was consistent with the previous studies which done by Omar & Orakwe (2006) and Ukenna & Monanu (2011). Traditionally, male were financial decision-makers while female were more conservative investors (Ukenna & Monanu, 2011). This shows that the perception and choice of banks are likely to vary significantly between male and female due to gender differences in financial behavior such as saving, investing, and the use of financial planners (Ukenna & Monanu, 2011).

Table 4: Gender Difference in Bank Selection Criteria

Criteria / Gender	Male		Female	
	Mean	**Rank**	**Mean**	**Rank**
Availability of 24 hours ATM services	4.49	1	4.51	1
High speed of transaction	4.46	2	4.47	2
Financial stability of bank	4.45	3	4.38	3
Confidentiality of bank customer record	4.36	5	4.32	4
Good security management	4.37	4	4.29	5

4.5.2 Age Group and Bank Selection Criteria

Table 5 shows that undergraduate students who aged 19 to 21 years old rated the availability of 24 hours ATM services (mean=4.52) and high speed of transaction (mean=4.52) as the most important criteria for their bank selection criteria, followed by confidentiality of the bank customer record (mean=4.44) and financial stability of the bank (mean=4.38). The higher transaction speed (mean=4.41) and financial stability of bank (mean=4.41) ranked the same value for respondents between 22 to 24 years old, while least important criteria for this category was the confidentiality of bank customer record (mean=4.27). Meanwhile, for undergraduate students belonged to the age group of 25 and above, financial stability of the bank (mean=4.57) ranked first, followed by high speed of transaction (mean=4.51) and the availability of 24 hours ATM serviced (mean=4.48). The speed of transaction is deemed to have different priority among these three age groups. It can be found that respondents with aged 19 to 21 years old (mean=4.52) and above 25 years old (mean=4.51) value their time higher and expect their banking transaction to be completed as quickly as possible compared to respondents belonged to 22 to 24 years old.

Table 5: Age Group Difference in Bank Selection Criteria

Criteria / Age Group	19-21		22-24		>25	
	Mean	**Rank**	**Mean**	**Rank**	**Mean**	**Rank**
Availability of 24 hours ATM services	4.52	1	4.49	1	4.48	3
High speed of transaction	4.52	1	4.41	2	4.51	2
Financial stability of bank	4.38	3	4.41	2	4.57	1
Confidentiality of bank customer record	4.44	2	4.27	4	4.26	5
Good security management	4.32	4	4.32	3	4.40	4

4.5.3 Ethnic Group and Bank Selection Criteria

Table 6 shows Malay respondents attach more important to high speed of transaction (mean=4.51) to save times. Meanwhile, both Chinese and Indian undergraduate students rated the availability of 24 hours ATM services as the central to the choice of banks due to easily access to their bank accounts. This indicated that both Chinese and Indian respondents have quite similar criteria in selection a bank. In terms of confidentiality of bank customer record and good security management, both criteria rate equally importance (mean=4.52) for Indian respondents. Chinese respondents more concerned with good security management (mean=4.54) compared to the confidentiality of bank customer record (mean=4.35). However, for Malay respondents, good security management (mean=4.19) and confidentiality of bank customer record (mean=4.31) had the least influence in the selection of banks. This shows that Indian respondents were more concerned on well keep and a highly confidentiality bank in dealing banking transaction.

Table 6: Ethnic Group Difference in Bank Selection Criteria

Criteria / Ethnic Group	Malay		Chinese		Indian	
	Mean	**Rank**	**Mean**	**Rank**	**Mean**	**Rank**
Availability of 24 hours ATM services	4.45	2	4.57	1	4.57	1
High speed of transaction	4.51	1	4.40	4	4.39	4
Financial stability of bank	4.34	3	4.51	3	4.56	2
Confidentiality of bank customer record	4.31	4	4.35	5	4.52	3
Good security management	4.19	5	4.54	2	4.52	3

4.5.4 Field of Studies and Bank Selection Criteria

Table 7 shows that both engineering students and non-engineering students have the same value traits in the availability of 24 hours ATM services and high speed of transaction due to save time and inefficiency counters during banking hours (Haron *et al.*, 1994; Rao & Sharma, 2010). Confidentiality of bank customer record was considered as third important criteria by engineering students, which ranked fifth by non-engineering students. Furthermore, results shows that non-engineering students (mean=4.42) were prefer to select a bank with more stable financial compared to engineering students (mean=4.41). This indicated that non-engineering students were more concerned about assurance of the bank services while engineering students gave a higher weight to privacy. This indicated that engineering students and non-engineering students have different perception in selecting their banks.

Table 7: Field of Studies Difference in Bank Selection Criteria

Criteria / Field of Studies	Engineering		Non-Engineering	
	Mean	**Rank**	**Mean**	**Rank**
Availability of 24 hours ATM services	4.51	1	4.49	1
High speed of transaction	4.47	2	4.45	2
Financial stability of bank	4.41	4	4.42	3
Confidentiality of bank customer record	4.42	3	4.26	5
Good security management	4.37	5	4.30	4

4.5.5 Income Level and Bank Selection Criteria

Table 8 shows the differences in bank selection criteria between middle-class (average household income within RM 1,000 to RM 3,000) and upper-class (average household income above RM 5001). Findings indicated that the most important criteria considered by upper-class respondents was confidentiality of bank customer record (4.34) and this criteria was ranked 4th places by middle-

class. This indicated that upper-class respondents were more focused on highly confidentiality bank and privacy when dealing banking transaction compared to middle class.

Table 8: Income Level Differences in Bank Selection Criteria

Criteria / Income Level	Middle-class (RM 1001 - 3000)		Upper-class (> RM 5,001)	
	Mean	**Rank**	**Mean**	**Rank**
Availability of 24 hours ATM services	4.51	1	4.26	3
High speed of transaction	4.45	2	4.29	2
Financial stability of bank	4.39	3	4.34	1
Confidentiality of bank customer record	4.32	4	4.34	1
Good security management	4.39	3	4.23	4

5.0 Discussion and Conclusion

The findings from the data collection were further discussed and summarized while looking into the two objectives determined in this study. As mentioned earlier, the findings of research objective (1) indicated that technology-based services which included the availability of 24 hours ATM services and high speed of transaction were the most importance criteria, followed by reputation of bank (financial stability of bank, confidentiality of bank customer record and good security management). Corporal effciency, convenience and financial benefits were found to be the least importance choice criterion in this study.

Results revealed that the criteria having the greatest influence on undergraduate students' bank selection decision was the availability of 24 hours ATM services. This show that current well-educated generation has a strong desire to make financial services available through the use of modern technology and less reliance on face-to-face interaction at the branch (Mokhlis, Salleh & Mat, 2011). The second most important criteria rated by undergraduate students were the higher transaction speed due to save time and no long waiting time at the bank counter (Kamenidou, Mamalis & Priporas, 2013). The financial stability of bank was rated as the third most important criteria influencing undergraduate students when selecting a bank. This findings indicated that university students in general have a greater knowledge regarding banking matters and more aware of the financial market (Mokhlis *et al*., 2011).

The fourth most important criteria were confidentiality of bank customer record, followed by good security management. Mokhlis *et al*. (2011) explained that this is due to consumers' high sense of insecurity such as financial risks, uncertainty on bank's stability and disclose their personal information. The proximity of bank to university which ranked twenty-two shows that location convenience is no longer a major influence on the undergraduate students' selection of a bank. As explained by Tank & Tyler (2005), the technological advances have replaced the previous placed on location convenience. Secondly, the findings of research objectives (2) clearly indicated that there is difference in bank selection criteria based on demographic variables. Results from the data analysis shows that male respondents view bank's financial stability and confidentiality of bank customer record were more importance than female due to gender difference in financial behavior (Ukenna & Monanu, 2011). In terms of age group, respondents with age 19 to 21 years old attach more to higher speed of transaction than the other two groups (22 to 24 years old and above 25 years old). Apart from that, Indian respondents were more concerned on a highly confidentiality bank compared to Malay and Chinese respondents when selecting a bank.

In addition to this, non-engineering students prefer to choose a bank with more stable financial whereas engineering students were more concerned on confidentiality of bank customer record. It is also found that respondents having higher income (above RM 5,001) were more attach to highly confidentiality bank record and their privacy than respondents having income level of RM 1,001 to RM 3,000. It can be concluded that the differences in demographic characteristics have different

perception in selecting a bank. As a result, this finding contributed an overview of bank selection criteria among undergraduate students in Malaysia for banks to provide more appropriate marketing strategies to attact this market segement.

La Construction d'un Baromètre du Bien-Etre dans les Espaces Urbains Marocains

Mostafa Abakouy : Enseignant-chercheur à l'Ecole Nationale de Commerce et de Gestion de Tanger – Maroc (Université Abdelmalek Essaâdi) Mail : mabakouy@yahoo.fr

Fadoua Laghzaoui : Enseignant-chercheur à la Faculté des Sciences Juridiques, Economiques et Sociales de Tanger - Maroc (Université Abdelmalek Essaâdi) Mail : laghzaouifadoua@yahoo.fr

Résumé

L'ambition de ce papier est d'étudier les déterminants du bien-être dans les espaces urbains.

S'inspirant de la démarche marketing urbain et fondée sur le cas des grandes villes marocaines, notre investigation essaie d'étudier le degré de compromis entre les variables quantitatives et variables qualitatives qui composent la qualité de vie des citadins marocains.

L'enseignement phare de notre recherche réside dans le fait que le bien-être tel qu'il est perçu par les habitants des grandes villes marocaines renferme plusieurs dimensions et que celles-ci devraient être déclinées en items pondérés selon leurs poids respectifs.

Mots-clés : Baromètre, Bien-être, citadins marocains.

Abstract

The aim of this paper is to study the determinants of well-being in urban spaces. Inspired by the urban marketing approach and based on the case of large Moroccan cities, our investigation is trying to study the degree of compromise between quantitative variables and qualitative variables that make up the quality of life of Moroccan citizens. The flagship education of our research lies in the fact that the well-being as perceived by residents of large Moroccan cities contains several dimensions and these should be broken down into items weighted according to their respective weights.

Keywords: Barometer, Wellbeing, Moroccan citizens.

Inroduction

Depuis le milieu des années 1990 et surtout depuis l'annonce en 2011 du projet de régionalisation avancée, les régions marocaines se sont vues attribuer de nouvelles missions à accomplir en vue de relever de nouveaux challenges. Les tendances actuelles convergent à confrirmer que le devenir du Maroc est dans la région et que l'Etat à organisation territoriale se substitue de plus en plus à l'Etat unitaire.

L'hebdomadaire marocain « La vie économique » en collaboration avec Valyans Consulting ont mené une étude le 24 septembre 2010 et ont constaté que les finances des communes sont excédentaires (cumulées dans plus de 25 milliards de DH en 2011) (Agoumi, 2011), ce qui fait contraste avec le besoin énorme en termes d'infrastructures et de maintenance. Pour pouvoir profiter de cette manne, il faut imaginer des projets, recruter des stratèges visionnaires et se comporter en marketers pour les commercialiser, lesquels stratèges et marketers sauraient se mettre à l'écoute du citoyen et répondre parfaitement à ces besoins en termes de confort et de bien-être.

Mais, encore faut-il savoir ce qui constitue le souci majeur des citoyens marocains. Plus précisément, nous nous posons les questions suivantes :

- Que peut-on entendre par confort, bien-être ou qualité de vie ?
- Comment peut-on le mesurer ?
- Quel impact de la taille des villes sur la perception du confort en espaces urbains marocains ?
- Quelle perception se font les marocains de leurs villes ?

- Le bien-être dans les zonnes urbaines étant pluridimenssionnel, quel équilibre y a-t-il entre ses composantes ?
- Comment une telle perception peut-elle orienter les décideurs locaux de telle sorte à répondre aux aspirations des citoyens ?

Tous ces questionnements sont focalisés sur les villes de Tanger, Casabalanca et Meknès puisqu'elles s'inscrivent dans le schéma de métropolisation et se positionnement sur des attributs différents en vue de répondre aux desideratas de leurs habitants respectifs.

Notre recherche se justifie par des intérêts d'ordre académique, pratique et méthodologique :

- Sur le plan académique, nous ambitionnons de mener une série d'investigations sur les villes vues sous une optique sociale, économique et managériale ;
- Sur le plan pratique, nous souhaitons nettement que les responsables locaux tireront des enseignements précieux à même d'élaborer des stratégies viables de développement urbain ;
- Sur le plan méthodologique, nous avons concentré notre réflexion sur la construction d'un baromètre de bien-être qui puisse allier pertinence (le baromètre est composé de thèmes jugés par les citoyens eux-mêmes) et soutenabilité (le baromètre saisit la perception du bien-être des citoyens d'aujourd'hui et ceux des générations futures).

En conjuguant le contexte ci-haut, nos questionnements et les intérêts de notre recherche, il nous a semblé impératif d'adopter une démarche aussi scientifique que rigoureuse possible. En effet :

- Nous avons débuté notre travail par une synthèse de la notion de bien-être (ou qualité de vie ou encore confort) telle qu'elle est appartient aux champs disciplinaires aussi variés que le marketing territorial, le management stratégique, les sciences sociales et politiques ;
- Ensuite, nous avons construit un outil qui permet de mesurer solidement le bien-être des citoyens des grandes villes marocaines ;
- Enfin, nous avons veillé à ce que la collecte des données et leur analyse obéissent aux normes de la recherche scientifique en préférant prendre, dans un premier temps, contacts et entrevues avec tous acteurs qui puissent apporter un éclairage sur le bien-être en milieu urbain et, dans un deuxième temps, fournir une grille qui puisse croiser les lectures des institutions internationales, des sources officielles nationales, de la presse et la perception propre des citadins marocains vis-à-vis de leurs cités.

Aussi, notre recherche est-elle structurée comme ci-après :
Dans un premier lieu, nous examinerons le sens que se donnent les chercheurs, praticiens, instituions internationales et les médias de la notion de la qualité de vie.
Dans un deuxième lieu, nous tenterons de synthétiser les différents thèmes qui ont été capitalisés au fil des années en vue de mesurer la qualité de vie tout en nous interrogeant sur la possibilité de hisser celle-ci en tant que concept solide et universel.

Dans un troisième lieu et après avoir rappelé notre démarche d'approcher le terrain en termes de recueil des données et de leur analyse, nous expliquerons la perception que se font les citadins marocains de la qualité de vie qu'ils mènent dans leur espace urbain.

1. Notion et Mesure de la Qualité de Vie en Milieu Urbain

En principe, le marketing adressé aux résidents vise deux populations : les résidents sur place et les éventuels habitants d'autres régions (nationales ou internationales) et qui pourraient être attirés par la ville (Meyronin, 2008). Cependant, dans la plupart des cas, on s'adresse moins aux potentiels (qui seraient à risques de chômage et d'insécurité) qu'aux habitants déjà établis, en s'efforçant d'améliorer leur qualité de vie.
Si les acteurs de la ville partagent le même espace urbain, ils sont tellement pluriels (Collectivités locales, citoyens, groupes d'intérêts, ONG, industriels, commerçants, Etat, organisations gouvernementales, établissements publics et para publics, etc.) que leurs préoccupations divergent.
L'ambition de ce paragraphe est d'essayer de dresser une liste d paramètres qui puissent mesurer la qualité de vie des habitants d'espaces urbains (§ 1.2). Mais, au préalable, il nous semble opportun de ratracer un fil historique de l'avenement du la notion de la qualité de vie (§ 1.1).

1.1. Sens de la qualité de vie

Déterminer les indicateurs de la qualité de vie demeure une préoccupation majeure à laquelle ne peuvent, désormais, pas se soustraire les recherches universitaires traitant de la gestion et du développement territorial. Il faut remarquer qu'une telle détermination n'est pas mécanique. Elle demeure une « approche » ou une « perception souvent subjective qui diffère d'une personne à une autre et d'un espace à un autre, et dont « l'objectivation », et partant, son « universalisation » demeure un exercice difficile et périlleux (Contrairement à l'OCDE qui aurait souhaité établir un indicateur objectif, solide et universel de la qualité de vie.).

La qualité de vie engendre plusieurs indicateurs dont la liste ne cesse d'être alimentée (mais par une espèce de capitalisation des indicateurs existants) d'année en année. Il existe des institutions, organismes et agences à l'échelle nationales et internationale qui définissent la qualité de vie.

Comme la qualité de vie se définit à travers les indicateurs qu'elle retient, les définitions qui lui ont été attribuées se distinguent par la nature des variables choisie pour la refléter. Or les vocables utilisés sont aussi divers que la qualité de vie, le bien-être, le confort ou le bonheur.

De point de vue marketing urbain, deux choix sont opérés quant à la terminologie : d'une part, et pour traduire la qualité de vie, on parle beaucoup de l'attractivité vis –à-vis des citoyens et, d'autre part, pour des soucis de sa déclinaison, on préfère soit la notion de batterie d'indicateurs (pour le suivi des politiques publiques), soit la notion de tableau bord (en vue de rappeler des points de repère, sensibiliser, alerter et surtout prendre des décisions locales appropriées) (Degron, 2010). Les américains, en inventant dès les années 1950 le concept *« the american best way of life »*, préfèrent le terme bonheur en vue de laisser le citoyen lui-même l'apprécier au lieu des scientifiques ou politiciens.

Dans ce qui va suivre, nous serons indifférents d'utiliser tel ou tel terme.

D'aucuns doutent de l'existence d'une définition de la qualité de vie communément admise (WHOQOLgroup, Kuyken, 1995) au sein de la communauté scientifique tous champs disciplinaires confondus, quoique le terme demeure récurent et à une grande échelle, essentiellement dans les discours politiques (Bech, 1987; Mercier, Filion, 1987 ; Spitzer, 1987*)*. Les tentatives de définition (oh ! combien massives) sont à chercher plus dans la tradition anglo-saxonne que dans le monde francophone puisque les dimensions qui composent la qualité de vie ne sont pas interprétées en français de la même façon qu'en anglais.

En revanches, des institutions internationales comme l'Organisation Mondiale de la Santé (OMS) ont tenté définir la qualité de vie comme « *la perception qu'a un individu de sa place dans l'existence, dans le contexte de la culture et du système de valeurs dans lesquels il vit, en relation avec ses objectifs, ses attentes, ses normes et ses inquiétudes. Il s'agit d'un large champ conceptuel, englobant de manière complexe la santé physique de la personne, son état psychologique, son niveau d'indépendance, ses relations sociales, ses croyances personnelles et sa relation avec les spécificités de son environnement* » (OMS, 1994). D'ailleurs, la majorité des théoriciens (Leplège, 2001; Rejeski, Mihalko, 2001), institutions et presses (Ipsos, 2008) internationales soulignent la multi dimensionnalité du phénomène dans la mesure où le concept englobe aussi bien l'état physique, l'équilibre psychique, la situation environnementale que l'aisance matérielle.

La littérature très abondante développée dans ce sens s'inscrit dans deux approches complémentaires, en l'occurrence l'approche liée à la santé et l'approche rattachée à l'environnement.

Sous une optique de situation environnementale (Mercier, 1994), la qualité de vie signifiait une panoplie de standards d'une vie confortable, standards supposés tous être objectifs comme la réduction du nombre de délits et de délinquants, la diminution du taux de pollution en termes de gaz à effet de serre, pollution sonore ou visuelle, la limitation de l'étendue des nuisances, l'augmentation des revenus et la multiplication de leurs sources, l'élargissement de l'ampleur du confort matériel, etc.

Or, très vite les différentes études (Irwin, Kamman, Dixon, 1979) menées sur le terrain ont fait ressortir deux constats majeurs qui vont battre en brèche l'objectivité stricte de la qualité de vie :

Primo, il n'existe pas de corrélation forte entre les standards objectifs et le bonheur quotidien des citoyens ;

Secundo, il n'existe pas toujours de corrélation entre une évaluation externe et une évaluation interne de la qualité de vie des individus.

Aussi, une nouvelle lecture subjective s'impose-elle de plus en plus dans la mesure de la qualité de vie.

Sous une optique de santé, il faut dire que le monde médical était très rigide quant à l'évaluation trop stricte du bien-être en prétendant le mesurer objectivement par le nombre de maladies, de troubles fonctionnels et le spectre des souffrances d'un individu. Il fallait attendre les années 1970 pour intégrer les notions « d'état de santé », de l'utilité et des liens sociaux (Bergner, Bobbit, Pollard, Martin, Gilson, 1976 ; Shea, King-Farlow, 1976), et la fin des années 1980 et au cours des années 1990 pour que les notions de capacités mentales, de liberté, d'indépendance, d'habiletés sociales, de compétences (Katz, 1987), de détresse psychologique, dépression (De Leval, 1995), de stress (Sorensen, 1994), etc., fassent partie intégrantes de la qualité de vie.

Bref, après s'être intéressé pendant longtemps aux variables objectives, le champ médical adopte largement les variables subjectives. Mais, il n'en demeure pas moins que des reproches lui soient adressés en optant pour des expressions souvent à connotation négative (souffrances, troubles, retard mental, détresse psychologique, stress, dépression, etc.) qui auraient traduit beaucoup plus le mal-être que le bien-être.

Qu'elle qu'en soit la mesure, la qualité de vie est un argument de poids de l'attractivité des territoires, alimentant la quasi-totalité des discours des responsables de la gouvernance locale. Encore faut-il savoir quels messages que ceux-ci véhiculent auprès des populations urbaines.

1.2. Mesure de la qualité de vie

La liste des indicateurs de la qualité de vie s'élargit de plus en plus, mais par souci de simplification, ils sont regroupés dans des catégories relativement homogènes. Par exemple, dans la rubrique « Equipements et infrastructures », on peut compter le nombre d'écoles par un périmètre donné, la présence d'une université, le nombre d'hôpitaux, la présence de services publics de proximité, le nombre de transport et de la mobilité urbaine, etc.

Quoique nombreux, les indicateurs de la qualité de vie sont définis selon des méthodes rigoureuses telles que le taux de chômage, le degré de pollution atmosphérique, le taux de participation aux élections, le nombre d'équipement sportifs ou culturels, le salaire net annuel moyen, etc.

Etant pluridimensionnelle, la notion de la qualité de vie pose le problème d'agrégation. A ce niveau, se pose le problème de la pondération des variables retenues et de leur substituabilité. Ces deux questions se posent à deux niveaux : intra et inter variables.

En France, la commission Stiglitz-Sen-Fitoussi (Commission Stiglitz, 2008) a mis en avant huit dimensions de la qualité de vie: conditions de vie matérielles (revenu, richesse …); santé ; éducation ; activités personnelles ; participation à la vie politique et à la gouvernance ; liens et rapports sociaux ; conditions environnementales ; insécurité physique et économique.

La pertinence de la mesure est garantie par une méthode appelée « vignettes » qui permet aux citoyens eux-mêmes de se retrouver le plus proche possible des situations qu'on lui propose, le but étant de ne pas influencer leur caractère optimiste ou pessimiste de l'individu. Cette pertinence est, par ailleurs, confortée par le fait que la qualité de vie est à la fois saisie dans son sens global et déclinée en sous indicateurs pondérés et hiérarchisés. La question de la synthétisation et de la hiérarchisation peut être résolue en proposant aux citoyens de pondérer eux-mêmes les dimensions de la qualité de vie, c'est ce que font les canadiens (Commission Stiglitz, 2008). Ces derniers, après

avoir mis le focus sur les métropoles et après avoir associé très fortement la qualité de vie à la santé des personnes (Sénécal, Collin, Hamel, Huot, 2008), le baromètre de la qualité de vie commence à partir des années 2000 à s'ouvrir, en s'inspirant de l'approche de Richard Florida sur de nouvelles dimensions telles que l'identité, la culture, le poids des artistes, la tolérance (Florida, 2004),

En comparant les pays les uns les autres, nous constatons que les catégories les plus fréquentes sont: équipements et infrastructure ; formation, emploi et revenus ; environnement, climatologie et reliefs ; aménagement territorial ; sécurité des personnes et des biens, etc.

La grande majorité des expériences internationales en matière de la qualité de vie ont été nourries par l'esprit de « maintenant et ici » et rares sont les pays (ou exactement quelques unes de leurs villes) qui ont lié la qualité de vie d'aujourd'hui à celle du futur. Concrètement, il fallait attendre les années 2000 pour qu'une nouvelle philosophie anime les responsable de l'ensemble de la planète, à savoir la soutenabilité (ou le développement durable) qui a entraîné de larges corrections quant au sens à donner à la qualité de vie en insistant sur la nécessité de réunir pour les générations futures des conditions de vie au moins égales à celle des générations actuelles. Dit autrement, il faut que le bonheur d'aujourd'hui ne fasse pas le malheur de demain. Il s'agit, d'une approche par le capital ou les stocks de ressources (Capital physique [comme les outils de production, bâtiments,], ressources naturelles [terres cultivables, ressources minérales, énergétiques et halieutiques, espaces verts, forêts et qualité de l'air, océans propres], capital immatériel [connaissance et techniques, moralité, principes, conscience et civilité]) et de capacités qu'il faut bien réserver aux citoyens futurs (UNECE/OECD/Eurostat, 2008), quoique le bien-être futur de chaque région ou de chaque pays soit fonction des externalités positives ou négatives qui viendrait d'acteurs appartenant à d'autres endroits (le réchauffement climatique n'est-il pas provoqué par le comportement de certains mais dont les méfaits sont subis par d'autres situés dans des régions bien lointaines ?)

C'est ainsi que les batteries d'indicateurs de la qualité sont mises à jour et se projettent de plus en plus dans le futur. Mieux encore, des pays (ou régions) ayant plus de conscience de la durabilité, non seulement intègrent le développement durable dans la mesure de la qualité de vie, mais aussi lui accorde plus de poids.

2. Perception de la Qualité de Vie dans les Grandes Villes Marocaines : Cas de Casablanca, Tanger et Mèknes

2.1. Objectifs et méthodologie de recherche

En 2011, l'hebdomadaire marocain La Vie économique (en collaboration avec Valyans Consulting) a établi un baromètre construit autours de six thèmes (santé [déclinée en : nombre de lits d'hôpitaux pour 10 000 habitants, présence d'un CHU, nombre de médecins pour 10 000 habitants, nombre de personnel paramédical pour 10 000 habitants.], éducation [déclinée en : scolarisation primaire et secondaire, étudiants du supérieur, réussite au baccalauréat], climat et environnement [déclinés en : climat, proximité à la mer, proximité à la montagne, environnement], culture [déclinée en : patrimoine culturel, n'ombre d'écrans de cinéma, nombre de bibliothèques nationales et régionales, nombre de festivals nationaux ou d'envergure internationale], logement [décliné en : disponibilité du logement, prix de l'habitat, équipements] et développement social [décliné en : indice de développement humain, sécurité, taux de pauvreté]).

Ce modèle est fondé sur des critères purement quantitatifs tout en distinguant les grandes villes de moyennes et de petites villes. Il a été promis de mettre à jour ce classement chaque année, mais aucune autre publication ne s'en est suivie.

A nos yeux, c'est une initiative très louable, parce que d'abord elle une première au Maroc, ensuite, elle a emprunté une démarche très rigoureuse et, enfin, on en tire des analyse denses et riches. Nous lui reprochons, toutefois, son caractère strictement quantitatif, sa nature statique (puisqu'il n'intègre pas la soutenabilité des critères de mesure du bien-être) et analyses purement descriptives n'éclairant pas suffisamment les responsables territoriaux sur les mesures à prendre et les actions à entreprendre. S'ajoute à ces remarques le statut institutionnel de la majorité des sources de données. Lesquelles sources ne font pas exprimer les citoyens sur leur perception de la qualité de vie qu'ils mènent, ne

sont pas actualisées et leurs statistiques collectées n'accordent pas suffisamment de poids d'ordre subjectif. Aussi, avons-nous jugé utile d'alimenter un tel modèle.

Ainsi, notre approche a-t-elle consisté à savoir les représentations que se font les citadins des grandes villes marocaines de leur espace urbain tel qu'il est vécu et interprété par eux-mêmes, d'après une enquête menée auprès d'un échantillon de 160 citoyens de la ville Tanger, 96 casablancais et quelques 48 citoyens de la ville de Meknes, un échantillon certes faiblement représentatif aux yeux des statisticiens, mais nous avons voulu mener des investigations approfondies en vue de nous approcher de la vérité. Puisque la prestation urbaine est coproduite entre offreurs et usagers, nous avons décidé d'intégrer des jugements des uns et des autres. Concrètement, et en vue de préserver notre neutralité, nous avons procédé par construire plusieurs indicateurs synthétiques composés par des items qui pourraient être modifiés par les enquêtés.

2.2. Essai d'élaboration d'un baromètre du bien-être dans les grands espaces urbains marocains

Désireux de coller à la réalité du terrain, notre modèle de mesure de la qualité de vie des citadins des grandes villes marocaines est le fruit de:

- la littérature concentrée sur la notion de qualité de vie ;
- l'étude de quelques expériences internationales ;
- les recommandations de la commission Stiglitz ;
- les définitions et directives des institutions mondiales ;
- la recherche exploratoire que nous avons menée auprès des habitants des grandes villes marocaines sur la signification qu'ils se font de la qualité de vie et les différentes rubriques composites.

Ainsi, avons-nous conçu la qualité de vie selon la grille suivante :

Grille de la qualité de vie en contexte urbain

Dimensions	Déclinaisons
Richesse, développement humain et pouvoir d'achat	▪ Dynamique économique ▪ Indice de développement humain ▪ Coût de la vie
Services à la population	▪ Etablissements de formation ▪ Etablissements de santé ▪ Raccordement aux services de base
Logement, transport et fluidité urbaine	▪ Accès au logement ▪ Mobilité urbaine ▪ Aménagement territorial
Climat, espaces verts et pollution	▪ Climatologie et reliefs ▪ Espaces verts ▪ Sources de pollution
Activités culturelles et sportives	▪ Organisation de festivals ▪ Salles de cinéma, espaces de culture ▪ Espaces et salles de sport
Soucis sécuritaires	▪ Sécurité physique ▪ Sécurité de biens et de patrimoine ▪ Sécurité économique
Identité locale	▪ Sentiment de fierté ▪ Tolérance

	▪ Citoyenneté

Conclusion

Au terme de cette recherche, comme les prestations urbaines sont co-produites entre offreurs et usagers (il en est de même pour la responsabilité qui ne peut être que partagée entre eux) et suite aux changements radicaux, en termes de défis et pomesses, qui se profilent à l'horizon des grandes villes marocaines (Haut Commissariat au Plan (HCP), 2004), notre grille de mesure de la qualité perdrait de son utilité si elle ne s'inscrit pas dans une approche dynamique. Au gré du temps, elle est invitée à être hiérarchisée, purifiée ou alimentée.

Les espaces urbains n'étant pas de même taille, la constructuction de cette grille serait probablement ajustée selon la taille des villes marocaines.

Ladite grille n'étant pas une fin en soi, il serait judicieux d'articuler à sa construction la perception que se font les citadins des grandes villes marocaines en les invitant à "noter" chacune des variables qui composent la qualité de vie dans leurs espaces urbains.

En parallèle, notre recherche fournirait matière à réflexion pour nos instituts de statistiques regionales et nationales en vue d'insérer dans leurs enquêtes des questions permettant de savoir la perception que tout un chacun se fait de la qualité de vie et de ses préférences. De tels instituts intervenants de façon périodique (après chaque dix ans!), notre vœu est plutôt de créer un observatoire permanent de la qualité de vie auprès des mairies (ou comunes urbaines) en vue d'étudier le degré de satisfaction de la vie des citoyens dans leur espace urbain. L'objectif ultime étant d'arriver un jour à dégager un débat public et obtenir un consensus sur les aspects de la qualité de vie urbaine tout en opérant des comparaisons entre individus, d'un même individu à travers le temps, entre villes d'un même pays et entre pays.

Abstract

L'objectif de cette recherche consiste à étudier et à comparer les principaux déterminants du développement du capital humain des PME ayant implanté des systèmes ERP open source et celles ayant implanté des systèmes ERP propriétaires/commerciaux. L'étude empirique a été effectuée auprès de dix PME réparties en deux groupes: un groupe de cinq PME avec des systèmes ERP open source et un groupe de cinq PME avec des systèmes ERP propriétaires. Nous avons utilisé deux théories pour élucider notre question de recherche. Les résultats de cette étude indiquent qu'il n'y a pas de différence entre ces deux groupes de PME en ce qui concerne les facteurs de développement de leur capital humain. Les résultats de cette recherche montrent que, dans le contexte d'un projet ERP open source ou commercial, le développement du capital humain est influencé par plusieurs facteurs d'ordre technologique, organisationnel et environnemental. D'après nos connaissances, aucune étude n'avait encore identifié les principaux facteurs de développement du capital humain dans le contexte d'un projet ERP. Nous avons étudié ce phénomène dans deux contextes distincts (projet ERP open source et projet ERP propriétaire), ce qui constitue une de nos principales contributions. Concernant les implications pratiques, cette étude permet aux gestionnaires des PME ayant déployé un système ERP de connaître les principaux déterminants de développement de capital humain, ce qui leur permet de mieux gérer l'évolution de leur système ERP.

Keywords : PME; capital humain; système ERP; Open source; propriétaire

1. Introduction

Les PME occupent une place importante dans la performance économique, financière et industrielle des pays développés. Sous la pression interne et externe croissante, les PME ont besoin, au même titre que les grandes entreprises, de systèmes d'information intégrés tels que les systèmes ERP. À cet égard, on assiste à une expansion rapide des ERP au sein des PME. Cette expansion est causée essentiellement par deux phénomènes : l'avènement des versions allégées des ERP propriétaires et l'émergence des ERP *open source*. Les gestionnaires des PME voulant adopter un système ERP ont ainsi le choix entre les deux stratégies logicielles suivantes: la stratégie logicielle orientée vers les systèmes ERP *open source* et la stratégie logicielle orientée vers les systèmes ERP propriétaires. Les systèmes ERP, qu'ils soient de type open source ou commercial, sont des systèmes d'information extrêmement complexes et difficiles à implanter, car ils intègrent plusieurs domaines fonctionnels sous une seule plateforme technologique. Leur implantation et évolution nécessitent un grand volume de connaissances et d'expertises. Ces connaissances et expertises constituent, d'après la littérature, du capital humain. Le capital humain est un facteur très important pour les phases d'implantation et de post-implantation des systèmes ERP.

Lengnick-Hall et al. (2004) ont émis plusieurs propositions qui mettent en exergue les bonnes actions à entreprendre pour le développement durable de l'avantage compétitif dans le contexte de système ERP en vue du développement du capital humain. Ils soutiennent en effet que les entreprises exploitant le capital social offert par un système ERP pour accroître leur capital intellectuel seront plus performantes que celles qui utilisent le système ERP seulement pour développer leur base de connaissances. La littérature soutient en outre que les communautés *open source* offrent plusieurs opportunités d'apprentissage (d'acquisition et de développement des connaissances et compétences) et de développement du capital humain à leurs membres. L'objectif de cette recherche est donc d'identifier et de comparer les facteurs de développement du capital humain des PME dans le

contexte d'un projet ERP *open source* et celui d'un projet ERP propriétaire/commercial, plus précisément durant la phase d'implantation. Nous avons choisi la phase d'implantation, car c'est la phase où les entreprises font appel à des partenaires externes qui supportent le développement de leur capital humain. Pour ce faire, nous allons d'abord positionner notre recherche par rapport à la littérature dans le domaine de la mise en œuvre des projets de systèmes ERP dans le contexte des PME. Ensuite, nous présentons les fondements théoriques qui nous ont permis de résoudre notre problématique de recherche. Puis, nous exposons notre méthodologie avant de présenter et de discuter les résultats de la recherche. Enfin, nous terminons par une conclusion qui met particulièrement en lumière les principales avenues à la suite de cette recherche.

2. Revue De Littérature

a. PME et Adoption des systèmes ERP

Les PME jouent un rôle vital dans les économies des pays développés et ceux en voie de développement (Fink et Ploder, 2009; Metaxiotis, 2009; Ramdani et Kawalek, 2009). Elles sont néanmoins généralement exposées à un haut niveau d'incertitudes environnementales et subissent des pressions au même titre que les grandes entreprises. En plus de ces incertitudes et pressions environnementales, contrairement aux grandes entreprises, les PME disposent moins de ressources. Pour rester compétitives, les PME doivent par conséquent continuellement innover et évoluer (Thong et Yap, 1994). Dans ce sens, elles ont recours aux outils de SI/TI[i] pour développer leurs marchés, augmenter leurs ventes et leurs chiffres d'affaires, accroître leur profit tout en sécurisant leur position concurrentielle au sein de leur industrie (Thong et Yap, 1994). Par souci de renforcement de leur position d'affaires et leur volonté de construire ou de maintenir leur avantage compétitif, plusieurs PME ont alors changé leur stratégie de SI en adoptant des systèmes d'entreprises, plus précisément des progiciels intégrés communément appelés systèmes ERP (Park *et al.,* 2007; Esteves, 2009).

b. ERP Open Source et ERP commerciaux : deux stratégies logicielles distinctes

Notons que les ERP propriétaires sont développés par des éditeurs privés alors que les ERP *open source* sont développés par des communautés *open source.* La littérature sur les communautés *open source* montre que le réseau social derrière le modèle de développement des logiciels libres est très différent de celui du modèle de développement des logiciels propriétaires. Cette différence se manifeste au niveau de plusieurs aspects importants comme, par exemple, au niveau (1) des objectifs primaires, (2) des mécanismes et processus d'apprentissage, (3) des modes de fonctionnement, (4) de la structure des relations sociales entre les membres du réseau, particulièrement des liens sociaux entre les utilisateurs finaux et les programmeurs, (5) de la perception de la propriété des connaissances (une propriété privée vs une propriété publique) (Hemetsberger et Reinhardt, 2006; Valintino-Couros, 2006; Wu *et al.,* 2007). Les communautés *open source,* supportant le développement des ERP, offrent en outre plusieurs opportunités d'apprentissage (d'acquisition et de développement des connaissances) (Valintino-Couros, 2006) et, surtout, de développement du capital humain (Wu *et al.,* 2007) à ses membres (actifs ou passifs).

c. Implantation de système ERP : un processus de développement du capital humain

Un système ERP est un ensemble de modules logiciels dont chacun couvre un périmètre fonctionnel spécifique partageant une même base de données commune (Xue *et al.,* 2005). D'après Wang *et al.* (2007), un projet ERP est un processus intensif de transfert de connaissances et la réussite d'un projet ERP repose sur le transfert de connaissances des partenaires externes aux ressources internes de l'entreprise cliente (i.e., l'entreprise mettant en œuvre le projet ERP). L'implantation d'un système ERP nécessite ainsi un grand volume de connaissances diversifiées, de compétences tout comme d'expertises métier et techniques, très spécifiques (Timbrell et Gable, 2002; Li *et al.,* 2006). Ces ressources intellectuelles représentent, selon Bontis (1998), du capital humain. Cabrera et Cabrera (2005) notent que le capital humain représente le stock de connaissances d'une organisation. Plusieurs auteurs soutiennent que le capital humain est une des principales sources d'avantage concurrentielle de cette ère numérique (Cabrera et Cabrera, 2005; Snell *et al.,* 1996; Hayes, 2003; Bontis, 1998). D'après Lengnick-Hall et Lengnick-Hall (2006), pour tirer un avantage compétitif à

partir de leurs systèmes ERP, les organisations ont besoin d'un vaste réservoir de talent, autrement dit, l'appui d'un vaste réseau de connaissances et d'expertises accessibles.

Vu que le capital humain est source d'avantage compétitif, cette recherche a pour but d'explorer les différents facteurs du développement de capital humain des PME dans deux contextes distincts : le contexte d'un projet ERP open source et celui d'un projet ERP propriétaire/ commercial.

3. Fondements Théoriques

Bien que la plupart des efforts de recherche sur les ERP soient en grande partie de nature descriptive avec très peu d'explications théoriques convaincantes (Tomblin, 2010), il est fondamental de mentionner cependant qu'il existe des théories ou méthodes pour explorer les principaux déterminants de développement du capital humain des PME au niveau d'un projet ERP. Ainsi, pour élucider notre problématique de recherche sur le développement du capital humain des PME en fonction de la stratégie logicielle lors d'un projet ERP, nous avons fait recours au cadre théorique TOE (Technologie, Organisation, Environnement) et à la théorie de la diffusion.

a. Le Modèle TOE

Le cadre théorique TOE a été élaboré par Tornatzky et Fleischer (1990). Il a été testé et validé par de nombreuses études dans le contexte de l'adoption des TI dans les PME (Chau et Tam (1997); Ramdani et al. (2009); Scupola (2009), etc.). Souvent utilisé pour étudier les déterminants de l'adoption d'une technologie, ce cadre théorique est, par conséquent, approprié pour explorer les facteurs pouvant influencer un phénomène organisationnel ou social lors de la mise en œuvre d'une innovation technologique comme l'adoption d'un système ERP. Notons que le cadre de Tornatzky et Fleischer repose sur trois éléments (ou contextes) pouvant influencer les processus par lesquels les innovations technologiques sont adoptées: (1) le contexte technologique; celui-ci concerne les caractéristiques ou attributs de la technologie adoptée en soi et leur impact sur le processus d'adoption; (2) le contexte de l'environnement / social; il s'agit de l'arène sociale dans laquelle l'organisation mène ses affaires; et (3) le contexte organisationnel; ce contexte décrit les caractéristiques intrinsèques à l'organisation pouvant avoir un impact sur le processus d'adoption d'une technologie lors des phases d'adoption et de mise en œuvre d'une innovation technologique.

Le cadre TOE a été utilisé dans plusieurs recherches dans le contexte de PME, particulièrement dans le champ de SI. À ce titre, nous pouvons soulever l'étude de Ramdani et Kawalek (2009). Ces derniers ont utilisé le cadre théorique de TOE pour étudier et classifier les différents facteurs ayant un impact sur le processus décisionnel de l'adoption des systèmes d'entreprise tels que les systèmes CRM, SCM, ERP, etc. Ils trouvent que l'adoption des systèmes d'entreprises dans les PME est influencée par deux contextes du cadre TOE: le contexte technologique et le contexte organisationnel. Toutefois, ils ne trouvent aucun impact des facteurs du contexte environnemental/ social sur le processus d'adoption des systèmes d'entreprise. Dans le cadre de cette recherche, nous allons au-delà de la recherche de Ramdani et Kawalek en nous intéressant au développement du capital humain des PME, durant les phases d'implantation et de post-implantation, dans les deux stratégies logicielles : ERP open source et ERP propriétaire. Comme nous l'avons déjà mentionné, l'objectif de cette recherche est de comparer les déterminants de développement du capital humain des PME des deux stratégies logicielles (ERP open source et ERP propriétaire).

Dans cette présente recherche, le cadre TOE de Tornatzky et Fleischer sera utilisé dans le but d'explorer les facteurs de ces trois contextes pouvant avoir un impact sur le processus du développement du capital humain des PME sur leurs systèmes ERP. En somme, cette recherche tente de fournir une meilleure compréhension des contextes (Technologiques, Organisationnels, Environnementaux/Sociaux) ayant un impact sur le développement du capital humain des PME ayant implanté des systèmes ERP commerciaux et celles ayant implanté des systèmes ERP open source.

b. La Théorie de la diffusion

Rogers (1995) a proposé une approche scientifique qui aide à comprendre les facteurs relatifs aux caractéristiques de l'innovation pouvant influer sur l'adoption et sur le rejet d'une innovation (technologique) en mettant l'accent sur l'importance du système social dans le processus d'adoption ou de diffusion de l'innovation. Les recherches utilisant la théorie de Rogers sur l'adoption d'une innovation ont été réalisées dans de nombreuses disciplines différentes telles que la sociologie, l'économie, le marketing, la gestion des opérations et les systèmes d'information (Aloini *et al.,* 2007). Selon la définition de Poutsma et al. (1987) du concept d'innovation, les systèmes ERP sont des innovations technologiques qui regroupent les meilleurs processus d'affaires et pratiques de plusieurs industries (Shiau *et al.,* 2009; Li et Lai, 2007; Swanson, 1994) et qui commencent par la base (Chang *et al.,* 2010). Un système ERP, qu'il soit de type propriétaire ou *open source*, est une innovation technologique de type IIIc (Shiau *et al.,* 2009; Swanson, 1994). Par conséquent, le développement du capital humain d'une PME ayant implanté un système ERP, quel que soit le type, peut, au même titre que le processus d'adoption ou de diffusion d'une innovation, être influencé par les caractéristiques de l'innovation technologique en soi parce que le développement du capital humain se fait dans le même système social au sein duquel se déroulent l'adoption et la mise en œuvre de l'innovation technologique. Rogers (1995) a montré que les caractéristiques importantes d'une innovation telles que perçues par les adoptants potentiels sont: l'avantage relatif (c'est-à-dire l'avantage concurrentiel pouvant être tiré de l'innovation); la compatibilité de l'innovation avec les opérations internes et les systèmes de l'organisation; la complexité (reflétant la compréhensibilité et la convivialité de l'innovation); la 'testabilité' (c'est-à-dire la possibilité de tester une innovation avant son adoption); l'observabilité des résultats.

Une des limites du modèle de Rogers se situe dans son faible pouvoir à expliquer les systèmes humains complexes tels que les relations et les interactions sociales soutenant les échanges ou transferts de connaissances. Pour pallier cette limite, nous combinons, dans le cadre de cette recherche, d'autres théories telles que le modèle théorique TOE de Tornatzky et Fleischer. Premkumar soutient qu'il y a très peu d'études ayant examiné les impacts des caractéristiques technologiques d'une innovation dans le contexte des petites entreprises (2003, cité dans Scupola, 2009). Pour mieux contribuer à l'avancée de la littérature et combler cet écart soulevé par Premkumar, nous utilisons la théorie de diffusion de l'innovation de Rogers dans le contexte des PME afin d'analyser et de comparer l'effet des attributs relatifs à chaque innovation technologique (ERP *open source* et ERP propriétaire) sur le développement du capital humain.

4. Méthodologie

Le but de cette recherche est d'investiguer s'il y a de la différence sur les principaux déterminants du développement du capital humain entre les PME ayant adopté des systèmes ERP open source et celles ayant adopté des systèmes ERP propriétaire. Berrios et Lucca (2006) ont soulevé plusieurs points que doit remplir toute recherche de nature qualitative. Les points soulevés par ces auteurs, pertinents dans la conduite d'une recherche qualitative, se retrouvent dans notre étude. L'approche méthodologique de la présente recherche repose en effet sur les postulats ou axiomes d'une recherche qualitative et empirique (Maxwell, 1996; Strauss et Corbin, 2004; Creswell, 2008; Yin, 2009). Dans cette étude, le choix d'utiliser une méthode de recherche qualitative a été fait sur la base de notre objectif principal qui vise, d'une part, à explorer les déterminants du développement du capital humain dans un projet ERP et, d'autre part, à comparer ces déterminants au niveau du projet d'un projet ERP open source et d'un projet ERP propriétaire. À noter que la recherche qualitative ne consiste pas à établir et à mesurer les relations entre la variable dépendante et les variables indépendantes, ni à tester des hypothèses, mais elle cherche à comprendre un phénomène à l'étude (Bock et Sergeant, 2002).

Plus précisément, nous avons utilisé l'étude de cas comme méthode de recherche. Les chercheurs en sciences sociales, en particulier ceux du champ des SI, ont fait un large usage de cette méthode de recherche qualitative pour examiner des phénomènes contemporains en situations réelles (Dubé et Paré, 2003). Benbasat *et al.* (1987) considèrent que l'étude de cas est la méthode de recherche appropriée lors de l'exploration de nouveaux domaines où peu de théories sont disponibles ou lors de

l'exploration des domaines dans lesquels les recherches et les théories sont à leurs premiers stades. L'intérêt croissant sur des questionnements d'ordre managérial et organisationnel sur les phénomènes relatifs à l'adoption des SI fait que les méthodes de recherche qualitative, plus précisément la méthode d'étude de cas, sont couramment utilisées comme méthode d'enquête et d'interprétation dans le champ de SI (Myers, 1997; Kouki, 2009; Yin, 2009).

La méthode d'étude de cas a été utilisée en effet, d'après Myers (1997), dans plusieurs recherches concernant l'adoption, la diffusion et l'usage des applications TI. Selon Yin (2009), trois éléments ou conditions permettent de choisir l'étude de cas comme stratégie de recherche : 1- le type de question de recherche posée; 2- la portée de contrôle du chercheur sur le phénomène à l'étude; 3-le degré de concentration sur les événements contemporains par opposition aux événements historiques. Par conséquent, nous avons opté pour l'étude de cas multiples comme stratégie de recherche car cette démarche est la plus appropriée pour mener à bien et à terme une étude comme la nôtre (Yin, 2009; Chen *et al.,* 2008), car une étude de cas multiples permet d'étudier un phénomène dans des contextes différents. D'après Miles et Huberman (1994), une étude de cas multiples permet, en particulier, de fournir une compréhension approfondie du phénomène à l'étude et de ses résultats tout en garantissant d'accroître les chances de tester des hypothèses au sujet de ce phénomène. Quant à notre échantillon, composé de deux groupes de PME (un groupe de PME ayant implanté de système ERP open source et un groupe de PME ayant implanté un système ERP propriétaire), nous avons établi les critères suivants pour la sélection des unités: (1) la taille de l'entreprise, c'est-à-dire que les entreprises choisies doivent être enregistrées comme des PME (Scupola, 2009; Kontinen et Ojala, 2011); (2) les PME choisies doivent déployer au minimum trois modules majeurs du système ERP (Jones, 2005; Helo *et al.,* 2008); (3) les PME choisies peuvent appartenir à des secteurs d'activités (Scupola, 2009) autre que le secteur informatique.

Avant de mener l'étude de cas proprement dite, nous avons d'abord fait une étude pilote et, au total, nous avons fait quatre entrevues (deux entrevues avec deux PME ayant déployé des systèmes ERP *open source* et deux entrevues avec deux PME ayant utilisé des ERP propriétaires). La commodité, l'accès facile et la proximité ont été les principaux critères du choix de ces études de cas pilotes (Yin, 2009). Ces entretiens nous ont permis de valider le questionnaire au sein de ces deux groupes de PME distincts et de vérifier la compréhension commune du questionnaire entre ces deux groupes de PME dans le but d'anticiper tout biais causé par le guide d'entretien. Cette activité a duré deux mois et demi. Le guide d'entretien a été élaboré sur la base de : 1) la revue de littérature sur le capital humain; 2) la théorie TOE; 3) la théorie de la diffusion. Le protocole d'entrevue était composé de plusieurs questions divisées en parties en fonction des concepts clés (ou thèmes) de notre problématique. Nous avons utilisé une grille d'entretien pour normaliser la collecte de données au cours des entretiens entre les deux groupes de PME. La collecte de données reposait principalement sur des entretiens semi-structurés. Pour chaque PME, nous avons procédé à une série d'entretiens individuels auprès de deux à trois informateurs. Chaque entretien a duré environ 60 à 120 minutes. Comme Jones (2006), nous avons demandé aux dirigeants[ii] de chaque PME d'identifier les principaux employés ayant été membres de l'équipe de projet ERP (c'est-à-dire, les informateurs clés de l'équipe de projet). Les informateurs ont tous été directement impliqués dans le projet de mise en œuvre du système ERP (voir **Error! Reference source not found.**). Au total, nous avons complété plus d'une vingtaine d'entretiens semi-structurés. Dans l'ensemble, les entrevues des deux groupes de PME ont duré un total de 40 heures (environ 2400 minutes). La majeure partie des entretiens étaient des entretiens face-à-face pour le cas des PME ayant implanté des ERP propriétaires.

Cependant, nous avons fait quelques entretiens téléphoniques pour la collecte de nos données, car nos répondants se trouvaient dans des localités géographiques distantes. Vu la position géographique de certains de nos répondants, nous avons utilisé des applications de vidéoconférences pour faire des entretiens téléphoniques particulièrement dans le cas des PME ayant implanté des ERP *open source*. Notons que nous avons trouvé plus de PME avec des ERP *open source* en Europe qu'au Canada. La rareté des PME avec des ERP *open source* au niveau du Canada peut s'expliquer par le fait de la récente émergence de ces ERP au Canada. Nous avons adopté une méthode de recherche basée sur une approche interprétativiste.

Comme le suggèrent Miles et Huberman (1994), Maxwell (1996) et Yin (2009), une triangulation (ou la multi-angulation) des données a été réalisée avec la mobilisation de multiples sources d'information : les entretiens semi-structurés; les discussions informelles; l'examen des documents

pertinents du projet ERP tels que le cahier de charges, les documents de contrat, les cartographies des processus, etc.

Comme le suggèrent Miles et Huberman (1994), Maxwell (1996) et Yin (2009), une triangulation (c'est-à-dire, la multi-angulation) des données a été réalisée avec la mobilisation de multiples sources d'information : les entretiens semi-structurés; les discussions informelles; l'examen des documents pertinents du projet ERP tels que le cahier de charges, les documents de contrat, les cartographies des processus, etc. La triangulation des données permet d'améliorer la qualité des données et, en conséquence, la précision des résultats; en d'autres mots, elle améliore l'exactitude et la crédibilité des conclusions tirées de l'analyse (Pak-Lok et Yuen, 2010; Maxwell, 1996; Deltour et Sargis Roussel, 2010). Avec l'autorisation préalable des informateurs, toutes les entrevues ont été enregistrées et des notes ont été prises (Van den Hooff et Huysman, 2009; Supyuenyong *et al.,* 2009; Deltour et Sargis Roussel, 2010). Toutes les entrevues ont été réalisées en français et transcrites dans cette même langue, mot à mot, en utilisant un traitement de texte. En suivant les démarches de Kontinen et Ojala (2011) et de Supyuenyong et al. (2009), des suivis d'appels téléphoniques et des messages électroniques ont été faits pour obtenir des informations complémentaires en cas de besoin et pour clarifier la compréhension de certaines questions ou certains points non abordés au cours des entrevues. Il a fallu douze mois pour compléter toute la collecte de données, à partir du premier rendez-vous jusqu'à la transcription.

Les données recueillies, à partir de toutes les sources, ont été classées en fonction des PME (Supyuenyong *et al.,* 2009). Les transcriptions des entrevues faisaient environ quatre cents pages sans compter les documents consultés. En suivant la démarche de Doom et al. (2010) et de Parry et Graves (2008), les noms des sociétés et les noms des informateurs ne sont pas divulgués pour des raisons de confidentialité. Un des groupes de notre échantillon est composé de cinq PME ayant implanté des systèmes ERP *open source* et l'autre groupe est composé de cinq PME ayant implanté des systèmes ERP propriétaires. Les entreprises dénommées *PME A*, *PME B*, *PME C*, *PME D* et *PME E* pour composer le premier groupe de PME. Les cinq entreprises dénommées par *PME F*, *PME G*, *PME H*, *PME I* et *PME J* constituent le deuxième groupe de PME. Soulignons que dans une recherche utilisant une étude de cas multiples, le nombre de cas recommandé par Eisenhardt (1989) est de l'ordre de quatre à dix.

Pour l'analyse des données, nous avons appliqué les stratégies recommandées par Miles et Huberman (1994). Nous avons en l'occurrence élaboré des feuilles-résumés, des codes, des mémos, des tableaux et des matrices pour effectuer nos analyses. Ces stratégies nous ont permis d'extraire les données et de les réduire, autrement dit, de les condenser. L'analyse des données[iii] a été réalisée sur la base d'un codage de l'ensemble des entretiens et, ensuite, par une approche d'analyse de contenu comme celle proposée par Miles et Huberman (1994). Une liste de catégories prédéterminées et de codes a été établie sur la base de la revue de la littérature et des théories utilisées (Scupola, 2009). Cette liste, décrite par Miles et Huberman (1994) comme une liste de départ, a été enrichie durant et après la collecte des données jusqu'à l'obtention d'une liste de codes quasi définitive. Le codage des entretiens s'est fait avec l'appui du logiciel QSR Nvivo 10. Nous avons eu quatre-vingt codes, vingt-cinq catégories et sous-catégories.

Tableau 1: Les principaux répondants de chaque cas

Groupe de PME	PME	Participants (informateurs)
Groupe de PME avec des ERP *Open Source*	PME A	• Directeur du département Informatique • Le directeur-adjoint du département informatique • Directrice des opérations et de R&D
	PME B	• Directeur administratif et des finances (associé) • Directeur et coordinateur TI
	PME C	• Directeur général (associé) • Directeur technique (associé)
	PME D	• Directeur de la production et des Achats; • Directeur technique (responsable R&D et du service après vente)
	PME E	• Directeur technique et responsable TI et de la comptabilité. • Directeur administratif (co-fondateur)
Groupe de PME avec des ERP Propriétaires	PME F	• Directrice du département TI • Directrice du département de crédit
	PME G	• Directeur de l'usine et de la production • Directeur des achats et approvisionnements
	PME H	• Directrice du département TI • Responsable et contrôleur du département de finance
	PME I	• Responsable TI • Directeur des ventes et du marketing
	PME J	• VP des finances • Chef de projet et directrice des analystes financiers

L'analyse des données sur les cas est, d'après Miles et Huberman (1994), composée de trois flux concomitants d'activités analytiques : la réduction des données; l'affichage des données; l'élaboration des tableaux de vérification des conclusions. Les deux procédés complémentaires, la déconstruction et la construction, constituent le fondement de l'analyse qualitative. À la phase de réduction, les données recueillies auprès des PME ont fait l'objet d'une codification. La codification consiste à appliquer un symbole à chaque groupe de mots de manière à réduire les données en unités, plus facilement analysables, et à mettre en évidence les mots les plus significatifs (Huberman et Miles, 1994). Par la suite, sur la base des entretiens, les caractéristiques uniques de chaque PME ont été identifiées et classées dans les tendances observées dans les sous-thèmes issus des questions de recherche.

Les tableaux de synthèse (voir

Tableau 2 et

Tableau **3**) montrent qu'il n'y a pas une différence notable entre les PME des groupes en ce qui concerne les caractéristiques de leurs projets ERP. Cette première étape de comparaison des caractéristiques intrinsèques des deux groupes de PME de notre échantillon, nous a permis de réduire tout biais par d'autres facteurs non liés au phénomène étudié.

Tableau 2: Résumé des cas du groupe de PME avec des ERP open source

	Secteur / produit	Chiffre d'affaires $$$ (Millions US)	Nombre employés	Nombre utilisateurs	Type de système	Nom du système	Pays	Type de stratégie d'implantation	Durée projet
PME A	Vidéo et TV sur IP	5 à 7	50	45	open source	OpenERP V.6.1*	France	Big bang	6 mois (novembre 2008 à avril 2009)
PME B	Ebénisterie architecturale (présentoirs et des étalages de magasins)	10 à 20	91	21	open source	xTuple ERP V.3.7.4*	Canada	Big bang	1 an et 6 mois (janvier 2010 à juin 2012)
PME C	Mécanique/ Intégrateur industriel de machine mécanique	5 et 7	27	20	open source	OpenERP V.6.1*	Suisse	Stratégie graduelle (par module)	2 ans (janvier 2007 à janvier 2009)
PME D	Fabrication automates de comptage des espèces	5	25	20	open source	OpenERP V.5.0.11*	France	Big bang	9 mois (juillet 2010 à avril 2011)
PME E	Fabrication des stations de recharge électrique à libre service et des vélos électriques	4 à 5	17	14	open source	OpenERP V6.1*	Suisse	Stratégie graduelle (par module)	1 an (phase de déploiement du 1er janvier 2010 au 1er juillet 2010 et la phase de migration du 1er juillet 2010 au 1er janvier 2011)

Tableau 3 : Résumé des cas du groupe de PME avec des ERP propriétaires

	Secteur / produit	Chiffre d'affaires $$$ (Millions US)	Nombre employé	Nombre utilisateurs	Type de système	Nom du système	Pays	Type de stratégie d'implantation	Durée projet
PME F	Fabrication et distribution de vêtements et produits sportifs	35 à 40	100	53	Propriétaire	Microsoft Dynamics AX version 2009*	Canada	Big bang	9 mois (du 1er mars 2009 au 1er décembre 2009)
PME G	Fabrication de produits pharmaceutiques naturels et alimentaires	15 à 20	250	50	Propriétaire	Genius ERP V. 3.1*	Canada	Big bang	1 an (début de janvier 2007 au début de janvier 2008)
PME H	Manufacturier/ Fabrication et distribution de produits destinés à la construction et la rénovation	35 à 45	150	80	Propriétaire	Epicor Vantage V. 8.03.408*	Canada	Big bang	1 an (de janvier 2006 à décembre 2006)
PME I	Manufacturier/ Fabrication et distribution de portes architecturales	20 à 25	125	53	Propriétaire	MK-ERP*	Canada	approche graduelle (module)	19 mois (du mois d'avril 2010 au mois de janvier 2012)
PME J	Service/ financement de microcrédits des projets agricoles et forestiers à l'étranger	13 à 18	58	36	Propriétaire	ERP Sage Accpac V.6.0*	Canada	Big Bang	1 an et demi (du mois de mai 2010 au mois de septembre 2011)

5. Analyse des Résultats et Discussion

Plusieurs facteurs (technologiques, organisationnels, environnementaux et sociaux) ont été soulevés par les répondants des deux groupes de PME, comme étant des facteurs significatifs au développement de leur capital humain interne.

c. Contexte technologique

Complexité du système ERP

Les répondants ont jugé que la complexité est le facteur technologique le plus important dans le développement de leur capital humain. Rogers (2005) définit la complexité comme la perception du degré de difficulté relative à l'utilisation et à la compréhension d'une innovation. Cette étude a trouvé la complexité du système ERP (plus précisément de l'architecture, de l'interconnexion des modules et des flux informationnels) comme étant un facteur clé sur le développement du capital humain. Toutes les PME du groupe ERP open source (PME A, B, C, D, E) et celles du groupe ERP propriétaire (PME F, G, H, I, J) ont considéré la complexité de leurs systèmes ERP comme un facteur ayant eu un impact sur le développement de leur capital humain, même si certaines d'entre elles ont trouvé que leurs systèmes ERP déployés avaient des ergonomies très conviviales pour la navigation.

Cependant, elles étaient unanimes sur la complexité de ces systèmes. La complexité rendait difficile la compréhension du système, autrement dit, le développement de leur capital humain. La complexité des systèmes ERP des PME, issues des deux groupes, limitait la capacité de celles-ci à développer des connaissances et des expertises suffisantes leur permettant de pouvoir apporter des modifications majeures. Ceci est en accord avec les conclusions de Robey et al. (2002) indiquant que la complexité d'un système ERP crée d'importantes barrières au développement de connaissances.

De plus, ce résultat est consistant avec la littérature sur les ERP soutenant que le système ERP est le SI le plus complexe à implanter et à faire évoluer (Okoli et Oh, 2007; Li *et al.*, 2006; Lengnick-Hall et Lengnick-Hall, 2004; Pan *et al.*, 2007; Dong-Gil *et al.*, 2005; Soh *et al.*, 2000). Voici quelques propos de gestionnaires ayant mentionné la complexité de leur système ERP:

- « Après, ce qui était plus difficile, c'était la complexité du système ERP de manière générale parce que c'est (qu') à même un outil qui regroupe tout » (Directeur TI, PME E).

- « On savait qu'on avait quand même un ERP qui se situait dans les key one. Donc, il y avait un niveau de complexité assez élevé. Dès le départ, la stratégie était de se munir de consultants [externes] qui allaient nous accompagner dans la configuration du système et puis dans le fond pour pouvoir s'approprier le système » (Directrice TI, PME F).
- « Je pense que c'est trop vaste et trop complexe pour dire qu'on la connaît pleinement » (Directrice TI, PME F).

Quant aux autres caractéristiques des systèmes ERP (tels que l'avantage relatif, la compatibilité, l'observabilité et la testabilité), ces facteurs n'ont pas été jugés importants par les répondants du groupe de PME avec des ERP *open source* et ceux du groupe de PME avec des ERP propriétaires comme étant des facteurs clés ayant un impact sur le développement de leur capital humain. Ainsi, seul le facteur de la complexité a été jugé important par les PME issues des deux groupes. Ceci démontre que, peu importe la stratégie logicielle (*open source* ou propriétaire) adoptée par la PME, un système ERP reste toujours une technologie très complexe à mettre en œuvre et que cette complexité impacte l'apprentissage, le développement des connaissances et des compétences des ressources internes affectées à l'implantation du système ERP.

d. Contexte organisationnel

Plusieurs facteurs organisationnels ont été jugés par nos répondants comme étant des factcurs important dans le développement de leur capital humain.

Soutien / implication de la haute direction

La plupart des PME, issues des deux groupes, ont considéré le soutien de la haute direction comme un des facteurs organisationnels importants dans le développement de leur capital humain. Toutes les PME du groupe avec des ERP *open source* et celles du groupe avec des ERP propriétaires ont mentionné ce facteur, car toutes les décisions majeures du projet émanent des membres de la haute direction qu'il s'agisse de recruter de nouvelles ressources humaines, d'allouer de nouvelles ressources financières pour maintenir la relation avec les partenaires externes ou pour payer les frais de formation pour des certifications, de décharger les membres internes de l'équipe de leurs charges de travail quotidiennes (voir

Tableau 4).

La haute direction peut fournir les ressources nécessaires à la mise en œuvre du système ERP (Thong *et al.,* 1994) aussi bien que celles nécessaires pour le développement du capital humain interne. Elle peut aussi stimuler les échanges et la communication entre les membres d'un projet ERP (Thong, 1999) et créer un environnement favorable à l'adoption d'une nouvelle technologie (Ramdani *et al.,* 2009). Plusieurs recherches ont identifié le soutien de la haute direction comme étant un des facteurs clés de réussite d'un projet de SI tel qu'un projet ERP (Thong *et al.,* 1994; Kale *et al.,* 2010; Yulong, 2011).

Les résultats de cette recherche corroborent les études antérieures sur l'importance du soutien de la haute direction dans la réussite d'un projet ERP (Thong *et al.,* 1994; Ramdani *et al.,* 2009) et, de plus, ils apportent de nouvelles connaissances en ce qui concerne l'importance du soutien de la haute direction dans le développement du capital humain des PME entreprenant des projets ERP. Ainsi, nous n'avons noté aucune différence entre les PME avec des ERP *open source* et celles avec des ERP propriétaires sur ce facteur, car toutes les PME de ces deux groupes ont soulevé ce facteur comme un des facteurs organisationnels ayant affecté le développement de leur capital humain interne.

Expertise TI/ ERP du département informatique

Cette étude trouve que l'expertise TI/ ERP du département informatique des PME est un facteur organisationnel critique au développement du capital humain. Toutes les PME du groupe ERP *open source* ont mentionné que le manque d'expertise TI / ERP de leur département informatique a été un obstacle au développement de leur capital humain interne, plus précisément au développement du capital humain technique. Dans le groupe de PME avec des ERP propriétaires, le manque d'expertise TI / ERP a été soulevé par quatre PME (PME G, H, I, J) comme étant un facteur ayant limité leur capacité de développement de leur capital humain interne. Seule la PME F de ce groupe avait à l'interne une bonne expertise TI/ ERP au niveau de son département et c'était la seule de ce groupe ayant soulevé l'apport positif de l'expertise TI/ERP de son département sur le développement du capital humain organisationnel. Ceci peut s'expliquer par le fait qu'elle était la seule PME à disposer d'assez de ressources au niveau de son département capables d'exploiter les connaissances et expertises partagées par son intégrateur pour développer son capital humain interne.

Ainsi, les PME (du groupe ERP *open source* et du groupe ERP propriétaire (PME G, H, I, J)), ne disposant pas d'assez de ressources au niveau de leur département informatique, étaient limitées au plan du développement de leur capital humain interne, particulièrement au développement de leur capital humain technique. Ceci est consistant avec les études antérieures (Thong *et al.,* 1994) soutenant que les PME ont une faible compréhension de l'informatique et manquent énormément d'expertise informatique à l'interne à cause du manque de personnel au niveau de leur département informatique.

Comme le notent Gutierrez *et al.* (2009), nombreuses d'entre les PME ont ni un responsable informatique ni un département informatique et, par conséquent, leur expertise informatique est faible et dépend des ressources externes de connaissances (consultants ou intégrateurs). Ceci est corroboré par les résultats de nos investigations dans cette recherche. À titre d'exemple, la PME D (du groupe de PME avec des ERP *open source*) et la PME J (du groupe de PME avec des ERP propriétaires) n'avaient pas de département informatique au niveau de leurs structures.

Quel que soit le type de stratégie logicielle adoptée par les PME, cette étude trouve que le manque d'expertise TI / ERP (c'est-à-dire la faible compréhension de l'informatique) est un déterminant, plus précisément un handicap majeur, au développement du capital humain technique des PME des deux groupes.

Planification du projet

La bonne planification du projet regroupe plusieurs éléments tels que la bonne affectation des ressources au projet, une vision globale de l'entreprise claire et motivante, une définition claire des objectifs stratégiques et de la portée du projet ERP, etc. Cette étude trouve que la bonne planification

du projet est un facteur organisationnel affectant le développement du capital humain des PME entreprenant un projet ERP. Quatre PME sur les cinq du groupe d'ERP *open source* (PME A, B, D, E) ont mentionné que la bonne planification du projet ERP a été un facteur important pour le développement de leur capital humain interne. Au niveau du groupe de PME avec des ERP propriétaires, quatre entreprises sur les cinq de ce groupe (PME F, G, I, J) ont mentionné que la bonne planification de leurs projets ERP a été un facteur clé ayant facilité le développement de leur capital humain (voir

Tableau 4).

Par exemple, dans le groupe de PME avec des ERP propriétaires, la PME F avait un plan du projet ERP bien structuré et planifié. Elle avait bien établi les objectifs avant le commencement du projet. Un des objectifs clairs fixés, dès le début du projet, par la haute direction était de développer une autonomie durant la phase de post-implantation vis-à-vis des sources externes de connaissances. Pour cela, les ressources internes de l'équipe du projet de la PME F avaient comme mandat de développer leurs connaissances et des compétences métier et techniques du système ERP.

« Notre objectif était d'être autonome le plus rapidement possible. On savait qu'on avait un tout petit budget pour le support de post-implantation. Durant le projet, on souhaitait seulement acheminer ce qu'on n'était pas à mesure de régler à l'interne vers l'externe [c'est-à-dire l'intégrateur], sinon on voulait absolument le prendre en charge et bien comprendre [le système ERP]» (directrice du département TI, PME F).

Dans la plupart des projets des PME au niveau des deux groupes, nous avons remarqué que les ressources affectées aux équipes chargées du projet étaient des utilisateurs clés ou membres de la haute de direction et avaient de bonnes connaissances des opérations internes de leur entreprise. Quant à la PME H, les ressources affectées au projet étaient déchargées de leurs responsabilités internes afin qu'elles puissent passer plus de temps à collaborer avec les ressources externes, ce qui a permis plus d'interactions. Cette planification du projet a permis aux ressources internes de développer plus de connaissances et d'expertises sur leur système ERP Epicor Vantage. En somme, cette recherche a trouvé que, quel que soit le type de stratégie logicielle (ERP *open source* ou ERP propriétaire), la planification du projet est un facteur organisationnel important au développement du capital humain des PME entreprenant un projet ERP.

Cette étude corrobore les recherches antérieures relatant l'importance du facteur de planification du projet sur la réussite d'un projet ERP (Loh et Koh, 2004), mais, de plus, elle fournit de nouveaux résultats pertinents en ce qui concerne l'importance de la planification du projet au niveau du développement du capital humain des PME entreprenant des projets d'ERP.

Programme de formation

D'après Chen *et al.* (2009), dans la pratique, les entreprises peuvent renforcer (ou développer) leur capital humain (interne) en embauchant de nouveaux employés qualifiés, ou en fournissant une formation suffisante aux employés, ou en motivant les employés avec des incitations attrayantes à partager leurs connaissances. Cette étude trouve que les formations reçues par les PME ont été un facteur clé au développement de leur capital humain interne. Dans le groupe de PME avec des ERP *open source*, les ressources internes de quatre cas entreprises sur cinq (PME A, B, D, E) ont reçu une bonne formation de la part de leurs partenaires externes. Les répondants de ces PME ont jugé que ces formations ont été importantes dans le développement de leur capital humain.

Par exemple, dans la PME A, pour donner la formation aux ressources internes de l'équipe, l'intégrateur a utilisé plusieurs moyens : des manuels, des extraits vidéos (c'est-à-dire des '*Webcast*' et des '*Screencast*'), un guide d'utilisateur et des fiches de procédures, etc. Par les programmes de formation, les partenaires externes transféraient leurs connaissances et expertises et, par conséquent, ils supportaient le développement du capital humain de leurs clients. Selon les répondants de la PME B, la formation technique et les manuels de formation fournis par l'intégrateur ont grandement aidé le personnel TI à comprendre le fonctionnement technique et l'architecture modulaire de leur système ERP xTuple.

Quant à la PME C, elle était la seule entreprise du groupe de PME avec des ERP *open source* n'ayant pas reçu de formation formelle d'un partenaire externe et, aussi, celle qui avait le moins développé son capital humain technique. Elle s'est autoformée en se basant sur les forums, les livres de formation (gratuits) en ligne de l'éditeur OpenERP et les « *launchpad* ». Cette autoformation n'a pas permis à la PME C de développer un capital humain technique pour configurer et paramétrer son système OpenERP en fonction de ses besoins fonctionnels, mais elle lui a permis de comprendre les flux informationnels entre les processus d'affaires des modules, autrement dit, de développer son capital humain métier.

Quant au groupe de PME avec des ERP propriétaires, toutes les cinq PME de ce groupe ont reçu des formations formelles données par leurs partenaires externes. Les répondants des PME de ce groupe ont trouvé que les formations ont permis à leurs ressources internes d'acquérir de nouvelles connaissances (sur les pratiques d'affaires et sur le volet technique) sur leurs systèmes ERP, autrement dit, de développer leur capital humain métier et technique. Certaines PME avaient un plan de formation plus élaboré que d'autres comme le cas de la PME H où, pour chaque département, la formation était donnée en deux phases : une avant le déploiement du module et une après le déploiement du module. Aussi, nous avons remarqué que les partenaires externes donnaient deux types de formations : une formation fonctionnelle sur les pratiques d'affaires (c'est-à-dire sur le volet métier ou affaires) plus donnée aux utilisateurs clés (membres de l'équipe) et une formation technique (sur le paramétrage des modules, configuration du système, etc.) plus donnée aux ressources informatiques (membres de l'équipe). La formation technique reçue par la PME F était plus avancée que celle reçue par les autres PME (issues des deux groupes) parce qu'elle était la seule PME qui voulait développer son propre capital humain technique lui permettant d'apporter des modifications majeures au système.

Voici quelques extraits des propos de gestionnaires mettant en évidence l'importance de la formation :

- « Le système [Microsoft Dynamics], il est assez complexe. Il est presque impossible d'opérer à l'intérieur du logiciel [c'est-à-dire de pouvoir apporter des modifications] sans une formation » (Directrice du département TI, PME F).
- « Vers la fin de la phase d'implantation, on avait gardé du temps de formation plus technique. Moi, je voulais absolument avoir les best-practices de Microsoft pour gérer notre

environnement le mieux possible [c'est-à-dire développer plus de capital humain technique interne] » (Directrice du département TI, PME F).

- « Pour la formation des super-users, il y a eu une bonne formation, ce qui nous a vraiment aidé à mieux comprendre le fonctionnement du système ERP » (Directeur de l'usine et de la production, PME G).
- « On a reçu une formation, avant, pendant le projet et après le projet » (Directrice du département TI, PME H).

Robey *et al.* (2002) ont souligné l'importance de la formation au niveau des projets ERP. Selon eux, dans un projet ERP, la formation peut aider une entreprise à surmonter les obstacles de développement des connaissances relatives à l'assimilation des processus d'affaires et celles concernant la configuration technique du système. L'importance de la formation comme facteur de réussite d'un projet ERP a largement été soutenue par la littérature (Scupola, 2009; Dorobat et Nastase, 2010; Kale *et al.*, 2010; Momoh *et al.*, 2010; Ifinedo, 2011). D'après Wang *et al.* (2007), la formation (formelle) est une forme d'apprentissage guidée dans laquelle le partenaire externe (consultants / intégrateurs ou éditeurs) peut aider l'entreprise cliente à acquérir de nouvelles connaissances et compétences nécessaires pour la réussite d'une mise en œuvre de système ERP d'où, selon ces auteurs, l'importance de sélectionner des partenaires qualifiés avant la mise en œuvre du système afin de profiter de leurs connaissances et expertises.

Cette étude corrobore les études antérieures sur l'importance de la formation à la réussite de projet ERP, mais de plus elle fournit de nouvelles connaissances pertinentes entre la formation et le développement du capital humain des PME dans le contexte d'un projet ERP. Cette étude trouve que la formation est un facteur crucial au développement du capital humain des PME, quelle que soit la stratégie logicielle choisie (l'implantation d'un ERP *open source* ou propriétaire). D'un autre côté, cette recherche appuie les conclusions des études antérieures sur le capital humain (Baldwin et Johnson, 1995; Chen *et al.*, 2009) en ce qui concerne l'apport de la formation dans le développement du capital humain organisationnel. D'après Baldwin et Johnson (1995), la formation permet à une entreprise de prolonger le processus d'enrichissement du stock de son capital humain, en d'autres mots, ces auteurs soutiennent que la formation prolonge l'enrichissement du capital humain d'une entreprise.

Capacité d'absorption

La capacité d'absorption est la capacité d'une organisation, avec ses ressources humaines, d'acquérir, d'assimiler (c'est-à-dire de comprendre et d'interpréter) et d'exploiter les nouvelles informations et connaissances externes. Au niveau de la littérature, plusieurs études ont soulevé l'effet de la capacité d'absorption sur plusieurs dimensions organisationnelles telles que la performance organisationnelle, l'adoption de nouvelles technologies, le transfert des connaissances technologiques (Ko *et al.*, 2005; Matusik et Heeley, 2005; Kwark et Shyn, 2006; Park *et al.*, 2007). Quelques-unes des recherches antérieures (Szulanski, 1996; Ko *et al.*, 2005; Minbaeva *et al.*, 2003) ont particulièrement relaté l'importance de la capacité d'absorption dans le processus de transfert et d'exploitation des flux de connaissances. Le développement du capital humain interne est soutenu par le transfert des connaissances des sources partenaires externes.

Cette étude trouve que la capacité d'absorption est un facteur crucial au développement du capital humain des PME durant la phase d'implantation de leurs systèmes ERP. La majeure partie des PME du groupe *open source* et du groupe propriétaire avaient plus de facilités à acquérir, assimiler et exploiter les connaissances métier (c'est-à-dire les connaissances concernant les pratiques, règles et processus d'affaires) et avaient plus de difficultés à acquérir, assimiler et exploiter les connaissances techniques. Les résultats de cette recherche trouvent que le groupe de PME avec des ERP *open source* ne diffère pas du groupe de PME avec des ERP propriétaires en ce qui concerne leur capacité d'absorption. Exceptée la PME F, nous avons remarqué que les PME des deux groupes avaient plus de capacité à absorber les connaissances métier (ou des pratiques d'affaires) transférées par leurs partenaires externes que de capacité à absorber des connaissances techniques transférées par leurs partenaires externes.

En somme, la majeure partie des PME du groupe *open source* (PME A, B, C, D, E) et propriétaire (PME F, G, H, I, J) avait une capacité d'absorption des connaissances techniques moins élevée que celle des connaissances métier. La source de ce manque de capacité d'absorption des connaissances techniques des PME, des deux groupes, provient du manque de personnel au niveau de leur département informatique (particulièrement de leur faible compréhension de l'informatique). La majeure partie des ressources internes ayant participé aux projets ERP, au niveau des deux groupes de PME, étaient des membres de la haute direction et avaient de bonnes connaissances du métier (c'est-à-dire sur les principales fonctions opérationnelles, sur les processus et pratiques d'affaires) de l'industrie dans laquelle œuvraient leurs entreprises. Ce faisant, ces ressources internes des PME avaient plus de capacité à acquérir et assimiler de nouvelles connaissances métier. Comme la PME A, la majeure partie des PME issues des deux groupes comptaient des gestionnaires au niveau des équipes qui avaient déjà de bonnes connaissances des fonctions opérationnelles.
« Puis, il y avait mon responsable. Il avait une bonne connaissance fonctionnelle des domaines concernés, car il était l'un des fondateurs de la société. Il avait établi le cahier des charges et, donc, il savait ce qu'il voulait et comment il le voulait […] Quand il s'agissait de parler de la partie fonctionnelle, lui [mon responsable], il maîtrisait bien comment ça fonctionnait au niveau de notre entreprise [et au niveau de l'industrie]» (le directeur-adjoint du département informatique, PME A).

Ceci est cohérent avec les résultats de Ravichandran (2005) soulignant que la capacité d'absorption d'une firme est influencée par deux éléments : les connaissances antérieures et les investissements pour acquérir et assimiler de nouvelles connaissances. Concernant les connaissances antérieures, ce ne sont pas les mêmes quand il s'agit de connaissances fonctionnelles (c'est-à-dire des connaissances métier) et de connaissances techniques au niveau des PME. Les résultats de cette recherche appuient les propos de Wang *et al.* (2007) qui indiquent que, dans un contexte d'ERP, les firmes peuvent différer sur leur capacité à absorber et à assimiler de nouvelles connaissances du système ERP. Les résultats de cette étude corrobore la littérature (Kwark et Shyn, 2006) en ce qui concerne l'influence de la capacité d'absorption sur le développement du capital humain, mais de plus ils apportent de nouvelles connaissances en trouvant que, dans le contexte d'un projet ERP, la capacité d'absorption des connaissances métier n'est pas la même que la capacité des connaissances techniques au niveau des PME. Ainsi, nous n'avons noté aucune différence entre les PME avec des ERP *open source* et celles avec des ERP propriétaires sur ce facteur.

Culture organisationnelle

La culture d'une entreprise est l'ensemble des croyances, des idéologies et des normes qui influencent les actions de l'organisation ou son comportement (Jones *et al.*, 2006). Palanisamy (2007) trouve que, dans le contexte d'implantation d'un système ERP, la culture organisationnelle influence les quatre composantes du processus de gestion de connaissances : 1- la création de connaissances, 2-le stockage et la récupération de connaissances, 3-le transfert de connaissances, 4-l'application ou l'exploitation de connaissances. Plusieurs études antérieures ont mentionné l'effet de la culture sur le partage et la gestion de connaissances (Cabrera et Cabrera, 2005) et sur la réussite d'un projet ERP (Soh *et al.*, 2000; Zhang *et al.*, 2005; Jones *et al.*, 2006; Ke et Wei, 2008).

Toutes les cinq entreprises du groupe de PME avec des ERP propriétaires et quatre entreprises du groupe de PME avec des ERP *open source* ont indiqué que leur culture organisationnelle a été un facteur clé du développement de leur capital humain (interne), car les pratiques culturelles de leur structure respective ont encouragé la collaboration, la communication et le partage de connaissances (voir

Tableau 4). Elles ont toutes mentionné que leurs organisations étaient des organisations souples et ouvertes au changement. Seule la PME B a mentionné que la culture organisationnelle était plutôt un frein au développement de son capital humain. Ceci peut s'expliquer en partie par le fait que la PME B était la seule PME, de toutes les PME issues des deux groupes, qui avait auparavant eu un système ERP (c'est-à-dire que la PME B était la seule PME ayant implanté un nouveau système ERP en remplacement de son ancien système ERP désuet). Comme le note la littérature, le système ERP peut modeler et influencer la structure organisationnelle, les processus, les procédures, les politiques, autrement dit, la culture organisationnelle (Lengnick-Hall *et al.,* 2004). La culture organisationnelle de la PME B était toujours ancrée à l'ancien système ERP.

> « Je dirai que ça [la culture] était même un frein. La culture, c'est le plus dur à changer même après quatre ans. Il y a certaines idées reçues qui ne sont pas nécessairement vraies, mais qui sont là. Elles font partie de la culture. Il y a une résistance quand même. Il y a des idées, des façons qui étaient dans l'ancien système ERP ». (Directeur et coordinateur, PME B)

Ce résultat appuie les propos de ODell et Grayson (1997) indiquant que la culture organisationnelle peut, à la fois, être un facteur clé facilitant le partage de connaissances ou un frein. Jones *et al.* (2006) ont trouvé que, dans le contexte d'un projet d'implantation de système ERP, la culture organisationnelle (c'est-à-dire les huit dimensions culturelles) affecte le partage de connaissances des membres de l'équipe en influençant les attitudes associées au partage de connaissances de ceux-ci. Cette étude corrobore les conclusion de Jones *et al.* (2006), mais de plus elle apporte de nouvelles connaissances en ce qui concerne l'effet de la culture organisationnelle sur le capital humain des PME, dans le contexte d'un projet d'implantation de système ERP. Toutefois, cette étude ne décèle aucune différence entre le groupe de PME avec des ERP *open source* et le groupe de PME avec des ERP propriétaires concernant ce facteur.

Qualité de l'équipe chargée du projet

Dans un projet d'implantation des SI traditionnels, l'entreprise peut ne pas recourir aux services des sources externes de connaissances, car elle peut disposer à l'interne de toutes les connaissances et compétences techniques. Ceci n'est pas le cas pour les projets de SI complexes comme les projets de mise en œuvre de système ERP. L'équipe d'un projet ERP doit posséder une grande expertise dans le domaine technique aussi bien que dans le domaine fonctionnel (Loh et Koh, 2004). Les études antérieures (Aloini *et al.,* 2007; Doom *et al.,* 2010) soutiennent qu'une bonne équipe de projet ERP doit être équilibrée en termes de compétences, c'est-à-dire qu'elle doit regrouper des experts internes et externes qui ont des compétences du métier, des connaissances approfondies sur les pratiques et processus d'affaires de l'industrie, et des compétences en TI. Elle doit bien comprendre la stratégie d'affaires (commerciale) de l'entreprise cliente et les modèles d'affaires incorporés dans le système. L'entreprise cliente doit, par l'équipe chargée du projet, disposer d'un capital humain suffisant lui permettant d'accomplir l'intégration fonctionnelle et l'intégration technique du système ERP à implanter.

Vu l'insuffisance de leur capital humain interne, la majorité des PME du groupe de PME avec des ERP *open source* (PME A, B, D, E) et du groupe de PME avec des systèmes ERP propriétaires (PME F, G, H, I, J) ont engagé du capital humain externe dans leur équipe chargée du projet. Excepté la PME C, toutes les équipes chargées du projet du groupe de PME avec des ERP *open source* (PME A, B, D, E) étaient constituées de ressources internes et de ressources externes. Ces ressources externes provenaient des firmes d'experts TI (externes) spécialisées dans l'intégration de système ERP ou des éditeurs. Les ressources externes provenant de ces firmes externes constituaient du capital humain externe pour les PME de ce groupe, car elles possédaient les connaissances et expertises techniques aussi bien que fonctionnelles concernant le système ERP pour lequel elles offrent leurs services d'intégration. L'équipe chargée du projet de la PME C était seulement composée de ressources internes, plus précisément de trois utilisateurs clés et d'aucune ressource externe. Quant au groupe de PME avec les ERP propriétaires, toutes les équipes de projets des cinq cas (PME F, G, H, I, J) étaient constituées de ressources internes (plus spécifiquement de super-utilisateurs) et de ressources externes provenant des intégrateurs.

Dans tous les cinq cas du groupe de PME avec des ERP *open source* et les cinq cas du groupe de PME avec des ERP propriétaires, nous avons remarqué que la plupart des ressources internes des PME membres des équipes du projet étaient des membres de la haute direction provenant de divers départements et avaient une bonne compréhension du métier de leurs organisations, c'est-à-dire une bonne vision et une bonne compréhension des flux informationnels des différents départements de leurs organisations. En ce qui concerne les connaissances des affaires, nous avons constaté que les ressources internes de ces PME disposaient de connaissances métier locales (c'est-à-dire la logique opérationnelle des fonctions de leurs organisations), alors que les ressources externes des intégrateurs (ou éditeurs) disposaient plus des connaissances métier des processus d'affaires incorporés dans le système, autrement dit, la logique opérationnelle se trouvant derrière les modules du système ERP auxquels repose l'architecture du système ERP. Ceci supporte les idées de Loh et Koh (2004) et Jones et Price (2004) qui trouvent que la composition d'une équipe multifonctionnelle est cruciale à la réussite d'un projet ERP. Newell *et al.* (2004) font référence au capital intellectuel pour désigner toutes ces ressources intellectuelles que doivent posséder les membres de l'équipe du projet du système ERP.

> « Le fait d'avoir une équipe pluridisciplinaire a vraiment facilité le projet, car l'information était disponible autour de la table. On n'avait pas besoin d'attendre derrière une personne pour avoir l'information; c'est quelque chose qui a facilité le projet. Les gens autour de la table [c'est-à-dire les ressources internes et les ressources externes] pouvaient ensemble, avec les échanges et les essais, régler les choses tout de suite » (PME G, directeur de l'usine et de la production).

La qualité de l'équipe chargée du projet comprend plusieurs éléments tels que la nomination de leader (ou champion) au projet, la bonne dotation en personnel de l'équipe de projet. La composition des équipes de projet comprend des ressources internes et externes. La qualité de l'équipe chargée du projet ERP a été considérée comme un facteur critique au développement du capital humain par les PME des deux groupes, excepté la PME C. La PME F a formé des petites cellules très restreintes afin de permettre à ses experts internes de profiter des connaissances et des compétences des experts de l'intégrateur. Un expert interne a plus de capacité à absorber de nouvelles connaissances poussées qu'un simple employé. Dans cette étude, nous avons remarqué que les ressources externes des partenaires (intégrateurs / consultants ou éditeurs) n'interagissaient qu'avec le personnel affecté au projet, autrement dit, les ressources internes de l'équipe jouaient le rôle d'intermédiaire entre les partenaires externes et les utilisateurs finaux. Toutes les connaissances et compétences partagées par les ressources des partenaires externes (consultants/ intégrateurs ou éditeurs) étaient transmises d'abord aux ressources internes de l'équipe du projet qui, à leur tour, formaient le reste du personnel (c'est-à-dire les utilisateurs finaux). Dans tous les 10 projets, nous avons remarqué que les ressources internes, membres du projet (autrement dit les experts fonctionnels internes), étaient le socle ou le réceptacle du développement du capital humain des PME. Ceci rejoint les études antérieures sur les ERP (Deltour et Sargis Roussel, 2010) décrivant les experts fonctionnels internes, membres de l'équipe du projet, comme des intégrateurs d'interface, c'est-à-dire les acteurs frontières porteurs des connaissances reçus des partenaires externes. Voici les extraits d'un gestionnaire de la PME A ayant souligné le rôle clé des experts fonctionnels internes dans le développement du capital humain organisationnel.

> « Les partenaires externes n'avaient pas de contacts directs avec les utilisateurs [finaux]. Ils avaient un contact direct entre moi et mon responsable [c'est-à-dire avec le directeur-adjoint et le directeur du département informatique]. Moi et mon responsable, nous avons récupéré plein de connaissances parce qu'on a fait l'intégration avec eux [les consultants] que ce soit des connaissances fonctionnelles ou techniques » (Le directeur-adjoint du département informatique, PME A).

« Aujourd'hui, en personne, à l'interne, il n'y a que moi en fait qui est à mesure de faire des choses avancées sur notre système OpenERP en termes de connaissances. » (Le directeur-adjoint du département informatique, PME A).

e. Contexte environnemental et social

Dans cette partie, nous allons analyser les facteurs environnementaux ou sociaux jugés importants par les répondants dans le développement de leur capital humain.

Expertise TI/ ERP des partenaires externes

Comme le notent Bessant et Rush (1995), dans le contexte SI tel que le contexte d'un projet de mise en œuvre d'un système ERP, le développement de la capacité technologique d'une PME se fait avec le support (ou l'aide) des partenaires externes (consultants / intégrateurs ou éditeurs) qui sont les principales sources de connaissances externes. Une des particularités des projets SI de type III (contrairement au projet de mise en œuvre d'une innovation technologique de type I, II) est qu'ils nécessitent une grande expertise technique aussi bien que métier (Shiau *et al.,* 2009) dont les entreprises, surtout les PME, ne disposent pas à l'interne. Ceci explique la nécessité de recourir à des partenaires externes de connaissances disposant des ressources intellectuelles (c'est-à-dire des connaissances, compétences et expertises) nécessaires. Plusieurs études antérieures (Thong *et al.*, 1994; Ramdani *et al.,* 2009; Ifinedo, 2011) ont trouvé une relation positive de l'expertise externe sur la réussite de projet ERP. Thong *et al.* (1994) trouvent que, dans le contexte d'une mise en œuvre d'un système ERP au niveau des PME, la qualité de l'expertise externe en SI est d'autant plus importante que le support / implication de la haute direction à la réussite du projet. Les projets de SI nécessitent des compétences techniques et métier que la plupart des gestionnaires des PME ne peuvent fournir (Thong *et al.*, 1994).

Toutes les cinq entreprises du groupe de PME avec des ERP *open source* (PME A, B, C, D, E) ont soulevé l'importance de l'expertise ERP de leurs partenaires externes sur le développement de leur capital humain interne. La PME C, à un moment donné, a fait appel à un intégrateur pour configurer son système OPenERP. Après quelques mois, les deux dirigeants ont vu que l'expertise TI/ ERP de cet intégrateur n'était pas si élevée. Ils ont fait appel à un deuxième intégrateur qui disposait d'une très bonne expertise TI/ ERP. Ce deuxième intégrateur a bien réussi à faire l'intégration technique et fonctionnelle du système, mais de plus, il a soutenu le développement du capital humain interne de la PME C. Depuis quelques années, cette dernière s'est associée à ce deuxième intégrateur pour donner des services de consultation auprès des entreprises, œuvrant dans le même secteur d'activités (c'est-à-dire l'industrie mécanique), entreprenant un projet de mise en œuvre d'OpenERP. Quant au groupe de PME avec des ERP propriétaires (PME F, G, H, I, J), elles ont toutes soulevé le rôle clé de l'expertise TI/ ERP des partenaires externes au développement de leur capital humain interne métier aussi bien que technique. La PME H était obligée de changer d'intégrateur parce que celui-ci avait un différend avec l'éditeur du système et ne pouvait plus continuer le projet de mise en œuvre du système ERP Epicor Vantage (c'est-à-dire donner des services de consultation). La PME H a fait appel à une deuxième firme d'intégrateurs qui était moins compétente que le premier intégrateur, autrement dit, l'expertise TI/ ERP du deuxième intégrateur était faible par rapport à celle du premier intégrateur, ce qui a obligé la PME H à trouver un troisième intégrateur ayant une expertise TI/ERP suffisante.

> « Le nouveau partenaire n'était pas capable de répondre adéquatement à nos demandes [nos requêtes]…. Il n'avait pas les mêmes compétences que le premier partenaire » (Directeur du département de finance, PME H).

Les partenaires externes (consultants / intégrateurs ou éditeurs) peuvent posséder une grande expertise technique du système ERP qui est le résultat de l'accumulation des expériences tirées de leurs mandats antérieurs (Jones, 2005). Nous n'avons noté aucune différence entre les PME du groupe d'ERP *open source* et celles du groupe d'ERP propriétaire, car toutes les PME de ces deux groupes ont mentionné l'importance de l'expertise TI/ ERP sur le développement de leur capital humain interne. L'expertise TI/ ERP est cruciale non seulement pour l'intégration technique et fonctionnelle du système ERP, mais de plus elle est cruciale pour le développement du capital humain interne des PME. Ce résultat corrobore les études antérieures (Thong *et al.*, 1994; Ramdani *et al.*, 2009; Ifinedo, 2011) ayant indiqué l'influence de la qualité de l'expertise TI/ ERP des partenaires externes sur la réussite d'un projet ERP, mais de plus, il apporte de nouvelles connaissances en trouvant la relation de l'expertise TI/ ERP des partenaires externes et le développement du capital humain des PME. La qualité de l'expertise IT/ ERP des partenaires est déterminante dans le développement du capital humain des PME parce que, comme le notent Timbrell et Gable (2002), les partenaires externes (consultants/ intégrateurs ou éditeurs) sont des pourvoyeurs de connaissances aux entreprises clientes, c'est-à-dire qu'ils peuvent fournir l'expertise (métier ou technique) nécessaire ou orienter l'approvisionnement des connaissances aux entreprises entreprenant un projet ERP.

Le tableau

Tableau 4 résume les principaux facteurs clés de développement du capital humain des PME avec des ERP open source et celles avec des ERP commerciaux : 1-le soutien de la haute direction; 2-la complexité, 3-l'expertise TI/ERP du département informatique, 4-implication des utilisateurs finaux au projet; 5-la bonne planification; 6-la formation; 7-la capacité d'absorption; 8-la culture organisationnelle; 9- la qualité de l'équipe chargée du projet; 10-l'expertise (TI/ERP) des partenaires externes.

Tableau 4: Facteurs clés de développement du capital humain des deux groupes de PME

Groupe	Groupe de PME avec des ERP *open source*					Groupe de PME avec des ERP propriétaires				
PME / Facteurs clés	PME A	PME B	PME C	PME D	PME E	PME F	PME G	PME H	PME I	PME J
Soutien/implication de la Haute Direction	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓
Complexité	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓

6. Conclusion

Le taux d'échec des systèmes ERP est de l'ordre de 40 à 60 % (Umble *et al.,* 2003; Li *et al.,* 2006), malgré l'expérience accumulée par les sources externes (consultants et éditeurs) (Ko *et al.,* 2005) sur ce type de projet. La littérature soutient fortement que le système ERP est un système très complexe à implanter et à faire évoluer (Soh *et al.,* 2000; Lengnick-Hall *et al.,* 2004; Ko *et al.,* 2005; Li *et al.,* 2006; Okoli et Oh, 2007; Pan *et al.,* 2007) et nécessite une variété de connaissances, de compétences autant techniques que métier. Ces ressources intellectuelles requises, pour son implantation et la gestion de son évolution, constituent du capital humain. Même si les communautés *open source* offrent plus d'opportunités de développement du capital humain à leurs membres (Wu *et al.,* 2007) que celles supportant le développement des ERP commerciaux, les résultats de cette recherche montrent que les facteurs affectant le développement du capital humain des PME avec des ERP *open source* sont similaires à ceux affectant le développement du capital humain des PME avec des ERP propriétaires.

Les résultats de cette recherche montrent aussi que le développement du capital humain, dans les contextes de projets ERP open source et propriétaire, est influencé par plusieurs facteurs d'ordre technologique, organisationnel et environnemental. La complexité du système ERP a été l'unique facteur technologique trouvé dans cette recherche ayant un impact sur le développement du capital humain interne des PME, quelle que soit la stratégie logicielle (ERP open source et propriétaire). Ceci s'explique par le fait qu'un système ERP, qu'il soit *open source* ou propriétaire, reste toujours l'un des SI les plus complexes à implanter. La complexité des systèmes ERP a été soulevée dans plusieurs études antérieures sur les ERP (Okoli et Oh, 2007; Li *et al.,* 2006; Lengnick-Hall et Lengnick-Hall, 2004; Pan *et al.,* 2007; Dong-Gil *et al.,* 2005; Soh *et al.,* 2000). En ce qui concerne les facteurs organisationnels, cette recherche en a trouvé plusieurs ayant un impact sur le développement du capital humain interne des PME, quelle que soit la stratégie logicielle (ERP open source et propriétaire) : le soutien / implication de la haute direction; l'expertise TI/ ERP du département informatique; la planification du projet; la formation (c'est-à-dire le programme de formation); la capacité d'absorption; la culture organisationnelle; la qualité de l'équipe chargée du projet. Pour le facteur concernant la capacité d'absorption, nous avons trouvé que les PME, quelle que soit leur stratégie logicielle, avaient deux types de capacité d'absorption : la capacité d'absorption métier (c'est-à-dire la capacité d'absorber et d'intégrer les connaissances métier) et la capacité d'absorption technique (c'est-à-dire la capacité d'absorber et d'intégrer les connaissances techniques).

Cette recherche a également trouvé que la capacité d'absorption technique des PME, quelle que soit leur stratégie logicielle, est moins élevée que la capacité d'absorption métier des PME. Ceci s'explique aussi par le fait que les PME avec des ERP *open source* et celles avec des ERP propriétaires n'ont pas assez de ressources humaines au niveau de leurs départements TI pour absorber les connaissances et expertises que partagent leurs partenaires externes durant le projet ERP. En ce qui concerne le contexte environnemental, nous avons trouvé un seul facteur ayant un impact sur le développement du capital humain interne des PME, quelle que soit leur stratégie logicielle: l'expertise TI/ ERP des partenaires externes. En somme, cette étude montre que le développement du capital humain interne des PME, quelle que soit leur stratégie logicielle est influencé par les trois contextes: le contexte technologique, le contexte organisationnel et le contexte environnement/ social. Les contributions de cette recherche sont multiples.

Concernant les contributions théoriques (Whetten, 1989; Corley et Gioia, 2011), on note que la plupart des recherches sur le système ERP manquent de fondements théoriques (Robey *et al.,* 2002). Nous avons contribué à l'extension de la théorie de Rogers et du modèle théorique TOE dans le champ du capital humain dans un projet SI/TI aussi bien dans le champ de projet ERP (commercial et open source). La théorie de Rogers nous a permis d'approfondir les connaissances sur les caractéristiques de l'innovation technologique (c'est-à-dire du système ERP) pouvant avoir un impact sur le développement du capital humain des PME. Parmi les facteurs de la théorie de la diffusion de l'innovation, la complexité a été le seul facteur identifié comme étant un facteur clé au développement du capital humain des PME. L'application du modèle théorique TOE dans cette étude a permis d'approfondir les connaissances sur les principaux contextes pouvant avoir un impact sur le

développement du capital humain des PME dans le contexte de systèmes ERP open source et propriétaires.

Cette recherche montre l'existence de plusieurs facteurs clés sur le développement du capital humain des PME durant l'implantation d'un projet ERP. Ceci constitue une contribution empirique de notre étude sur l'avancement des connaissances. En ce qui concerne, les implications pratiques de cette recherche, les analyses de cette étude permettent de tirer des conclusions et des leçons fort intéressantes pour les praticiens (les gestionnaires des PME et les firmes TI spécialisées dans les projets ERP). Vu que le capital humain est source d'avantage compétitif, les gestionnaires des PME, voulant développer leur capital humain pour bien gérer leurs systèmes ERP, doivent se préoccuper des facteurs d'ordre technologique et environnemental, mais doivent surtout porter plus d'attention aux facteurs du contexte organisationnel.

Une des limites de cette recherche se situe sur la composition de notre échantillon. Toutes les PME sélectionnées dans cette recherche se trouvent dans des contextes francophones (Québec, France, Suisse). Toutes les cinq PME avec des ERP propriétaires (PME F, G, H, I, J) sont de Québec, alors que les PME avec des ERP *open source* sont localisées entre la France (PME A, D), le Québec (PME B), la Suisse (PME C, E). Un biais culturel pourrait exister entre les pays européens (Suisse, France) et le Québec. Les futures recherches pourront à cet égard considérer cette limite en prenant des PME localisées dans des contextes anglophones. Plusieurs avenues de recherche se dessinent avec les résultats de cette recherche. L'étude du développement du capital humain dans les entreprises de service TI est une piste future à explorer.

Résumé

Bien que plusieurs études se soient attelées à l'analyse de la relation communautés de pratique et innovation, la majorité souligne une relation significative entre les deux concepts. Nous avons dans le cadre de ce travail de recherche, essayé de prendre part à ce débat et étudier cette relation en mettant l'emphase sur leurs caractéristiques, leurs orientations cognitives et la démarche d'apprentissage poursuivie. L'objectif de ce travail consiste à comprendre le rôle des communautés de pratique dans le développement de l'apprentissage et l'innovation. L'approche abductive que nous avons adopté, dans le cadre de notre positionnement interprétativiste, nous a permis d'enrichir le cadre conceptuel rattaché à l'innovation au sein des communautés de pratique. En effet, nous avons démontré que les communautés de pratique s'insèrent dans une perspective d'apprentissage adaptatif par accumulation de l'expérience et paraissent peu adaptées à des périmètres évolutifs et se limitent, donc, au développement de l'innovation d'exploitation. Mais contrairement à ce qui a été relevé de la littérature, les enseignements empiriques inhérents à l'analyse de six communautés de pratique, montrent que, les communautés de pratique favorisent essentiellement un apprentissage par exploitation comme elles peuvent atteindre l'exploration. Les constats soulevés montrent aussi que, généralement, ces communautés sont sources d'innovations d'exploitation. Cependant, nous avons constaté certaines exceptions. Dans certains cas, ces structures ne permettent pas l'innovation d'exploitation, quand elles ont comme objet seulement, la résolution des problèmes liés à la pratique. Dans d'autres cas, ces communautés se sont révélées être sources aussi bien d'exploitation que d'exploration de nouvelles solutions.

Mots clés : Communautés de pratique, apprentissage, innovation, banques, Tunisie.

Introduction

La performance des entreprises est le résultat de nombreux facteurs, parmi lesquels leur capacité à innover (Deltour et al, 2014). Les communautés de pratique sont nées du besoin éprouvé par chacun d'échanger et de se regrouper avec ceux qui ont des intérêts et des préoccupations identiques. De fait, son existence se renforce par le constat que la réflexion collective aide à la résolution des problèmes. Elles constituent, ainsi, un lieu de professionnalisation utile aux individus et aux organisations (Panisse, 2004). Les communautés de pratique, paraissent ainsi optimales pour la recherche de l'innovation : elles permettent à travers leurs capacités dynamiques d'apprentissage de reconfigurer les ressources et de s'adapter aux environnements changeants. Nous allons dans ce qui suit définir les communautés de pratique, présenter leur fondement et les objectifs retenus afin de comprendre leur rôle dans le développement de l'apprentissage et de l'innovation.

I- Revue de la littérature

Si la littérature consacrée à l'innovation et l'apprentissage est foisonnante, relativement peu de travaux étudient cette relation spécifiquement dans le cadre des communautés de pratique. Afin de dépasser leur simple description, différents cadres d'analyse peuvent être mobilisés pour comprendre les démarches et les modes de fonctionnement à l'œuvre.

I.1. Les communautés de pratique : un espace identitaire de socialisation

Le vif intérêt suscité aujourd'hui par l'idée de communauté de pratique tient au fait que les entreprises opèrent dans une économie basée sur la connaissance, dans laquelle le principal actif stratégique réside dans les savoirs. Les théoriciens des communautés de pratique, à l'instar de Brown et Duguid (1991, 2001), démontrent que c'est au sein de ces communautés que ces actifs stratégiques se développent le plus vite et le mieux.

La communauté de pratique résulte le plus souvent des insuffisances perçues dans le fonctionnement de l'organisation formelle, ainsi que des limites des compétences du personnel face aux exigences de la direction. Cette situation peut conduire les acteurs issus d'une même spécialisation à nouer des relations informelles afin de résoudre rapidement les problèmes rencontrés et orienter leurs actions sur la base des affinités culturelles ou religieuses (Nkakleu et al., 2004).

I.1.1 Définition du concept

Les communautés de pratique ont été largement analysées et étudiées en tant que nouvelle forme organisationnelle favorisant essentiellement le partage d'intérêts (Davenport et Hall, 2002) et permettant la création de savoirs collectifs. La définition proposée par Lave et Wenger (1990), met l'accent sur l'engagement des individus dans une même pratique impliquant une communication régulière au sujet de leurs activités. Ces derniers cherchent essentiellement à développer leurs compétences dans la pratique considérée (Créplet et al., 2000). Pour Brown et Duguid (1991), et Wenger (2000), elles représentent un groupe informel d'individus qui partage un intérêt, un ensemble de problèmes ou une passion pour un sujet, et qui approfondit ses connaissances et son expertise dans ce domaine en interagissant de manière continue. Ces individus ne travaillent pas nécessairement ensemble mais ils ont une histoire commune liée à leur pratique. Leur existence est informelle, les membres forment spontanément une communauté afin d'apporter des solutions à des problèmes communs ou proposer des améliorations dans une pratique commune (Cappe, 2005). Geynet (2003) les assimilent à des groupes d'individus ayant une même formation professionnelle ou encore concernées par un intérêt commun. Qu'elles soient formelles ou non, les communautés de pratique sont des groupes auto-organisés qui recrutent leurs membres par cooptation (Wenger et Snyder, 2000).

Dameron et Joserand (2005) la définissent comme un groupe auto organisé d'individus partageant le même centre d'intérêt, qui par des interactions régulières, développent des pratiques et expertises partagées dans ce domaine ; et par la même génèrent une identité commune par la socialisation. L'auto organisation se révèle comme une caractéristique essentielle distinguant l'existence d'une communauté de pratique, elle présente la capacité d'un système à acquérir de nouvelles propriétés en s'organisant lui-même ou en modifiant par lui-même sa propre organisation (Brown et Duguid, 1991 ; Lesourne, 1991 ; Wenger, 1998).

I.1.2. Concepts clés et critères d'identification des communautés de pratique

Wenger et Snyder (2000) présentent une communauté de pratique comme une association de trois fondements : un domaine de connaissances définissant un ensemble de sujets à traiter (l'existence d'un sujet présentant un intérêt commun pour un groupe), une communauté de personnes s'intéressant à ce domaine et une pratique partagée qu'ils déploient afin d'agir dans le domaine. D'après Cappe (2005), l'inscription de la communauté dans un périmètre défini permet à ses membres de bénéficier d'une légitimité, autorise et explique sa contribution à la communauté. Cette appartenance assure à la communauté que chaque membre a la connaissance du contexte nécessaire à la compréhension des sujets et des problèmes abordés. De même une vision claire des limites du domaine permet d'une part aux membres de se consacrer précisément et exclusivement à des sujets du domaine sans divergence et d'autre part, d'identifier au sein de la communauté de pratique, l'existence et le développement de compétences sur le domaine défini. Ce même auteur synthétise

neuf critères d'identification des graines de communautés de pratique comme le montre le tableau suivant :

Tableau 1 : Critères d'identification des graines de communautés de pratique (Cappe, 2005, p.8)

Concepts clés des CP	Composants	Critères d'identification des graines des communautés de pratique
Domaine		Sujet d'intérêt commun
Communauté	Entreprise commune	Action volontaire
	Engagement mutuel	Entraide Appréhension commune Connaissance mutuelle
	Répertoire partagé	Outils partagés Histoires
Pratique		Besoin de savoirs similaires Pratique similaire

L'entreprise commune peut, donc, se définir par la pratique que les participants de la communauté partagent en commun, incluant leur processus collectif permanent de négociation du comment mieux faire dans cette pratique. L'entreprise commune est basée sur l'idée que les individus appartenant à une communauté de pratique, s'engagent dans des actions collectives (Habhab-Rave, 2006). L'engagement mutuel suppose un rapport d'entraide entre les participants, nécessaire au partage des connaissances sur la pratique ou de concepts théoriques, notions et idées qui découlent du travail effectué (Lafferière et al., 2006). La notion d'identité, caractéristique clé de l'auto organisation, est visible dans l'engagement mutuel, elle est construite autour des activités comprises de façon commune et continuelle pour garantir la négociation des membres, comme le soulignent Créplet et al. (2003). L'engagement dans des pratiques communes fait ainsi naitre progressivement un répertoire partagé et entretient la construction sociale de significations (Vaast, 2001).

I.1.3. La valeur ajoutée des communautés de pratique

Les communautés de pratique ont une capacité à aider les entreprises à réaliser leur stratégie d'affaire, ouvrir de nouvelles perspectives, résoudre des problèmes, améliorer la transmission des meilleurs pratiques et développer des compétences professionnelles (Wenger et Snyder, 2000). Plusieurs chercheurs (Fontaine et Millen, 2004 ; Wenger et al., 2002) supposent que les communautés de pratique offrent pour l'organisation, une occasion d'échange entre salariés et métiers travaillant sur un même produit ou un même projet. Dans ce cas, elles réduisent le risque de duplication de l'information ou d'efforts permettant de développer des solutions similaires comme l'ont démontré Lesser et Storck (2001). Les chercheurs de CERFIO[1] (2005), soulignent ses bénéfices potentiels : Gains de productivité, apprentissage et innovation, et, explique qu'elles sont généralement reliées à la notion d'apprentissage, considérée comme source possible de gain de productivité et, facteur de motivation et de loyauté, sources indirectes de gain de productivité. Elles constituent un moyen de choix pour le transfert, l'échange et le partage de savoir entre employés expérimentés et novices, un foyer idéal de transmission de valeurs et des façons de faire. L'une des valeurs ajoutées des communautés de pratique, en tant que lieu et moyen facilitant l'échange et la résolution des

[1] Centre Francophone D'informatisation Des Organisations

problèmes, consiste donc à favoriser l'esprit d'innovation et permettre de mieux répondre et plus rapidement aux attentes du marché et celles des clients (Lesser et Everest, 2001).

I.2. Les spécificités du mode d'apprentissage dans les communautés de pratique

Les premiers travaux sur les communautés de pratique s'inscrivent dans le courant situationniste de l'apprentissage mettant en exergue le caractère réciproque de l'interaction dans laquelle les individus, sont considérés comme culturellement et socialement construits (Lave et Wenger, 1991), et par la contingence de l'apprentissage à la pratique (Brown et Duguid, 1991 ; Wenger, 1998).

Pour appréhender l'apprentissage à travers les communautés de pratique, nous allons, mettre l'accent sur les caractéristiques d'une communauté de pratique et, repérer les déterminants et les dimensions de l'apprentissage qui concordent avec ces caractéristiques ainsi que le résultat induit par l'apprentissage.

I.2.1. La pratique : source de structure sociale rattachée à un domaine spécifique

Wenger (1998) appréhende la pratique comme source de structure sociale et l'apprentissage comme une participation sociale où se négocient les significations relatives à l'action. L'engagement dans un processus d'apprentissage dans une communauté de pratique s'explique ainsi par l'acquisition et la création de connaissances étroitement associées à la pratique. Ainsi, ce qui importe dans une communauté de pratique sont les pratiques que développent les membres de la communauté en exerçant leur activité. Le type d'apprentissage développé est ainsi considéré comme un processus d'acculturation des individus à leur milieu (Soulier, 2005). Wenger (1998) utilise la négociation de sens comme caractéristique intrinsèque aux communautés de pratique, à travers une dimension sociale qui présume la conclusion d'un accord entre des individus, et une dimension pratique relevant du savoir-faire qui exige une adaptation aux situations. L'engagement dans une pratique sociale représente le processus fondamental par lequel on apprend et on évolue en tant qu'être humain. La notion d'action est alors, appréhendée en lien avec les pratiques quotidiennes des individus apprenants, engagés individuellement et collectivement dans des activités de résolution de problèmes (Barbaroux et Gode, 2011).

I.2.2. La socialisation : une caractéristique des communautés de pratique et un résultat induit par l'apprentissage

Les communautés de pratique sont assimilées par Lave et Wenger (1991) à des lieux de socialisation où les connaissances tacites sont transmises directement par la pratique. Elles sont considérées comme déterminantes pour faire émerger un apprentissage par la pratique dans l'action. Ils font ressortir un mécanisme d'apprentissage social propre aux communautés, que Cohendet et ses collègues (2006), qualifient d'apprentissage par socialisation indissociable de la pratique dans un contexte social donné d'activités. Un mécanisme qui à leur sens, permet l'échange de savoir-faire tacite socialement localisé (Brown et Duguid, 2001 ; Nonaka et Takeuchi, 1995), et facilité par la construction d'un répertoire partagé de ressources communes (routines, artéfacts, styles…) (Bootz et Kern, 2009).

I.2.3. L'accumulation et le partage des expériences passées : une voie d'apprentissage par ajustement au sein des communautés de pratique

Les expériences passées constituent un déterminant de l'apprentissage (Senge, 1990). Ce qu'un individu apprend dépend fortement de ce qu'il sait déjà mais aussi de ce que les autres savent et croient : c'est dans l'interaction que l'individu se construit et apprend (Leroy, 1998). Les acteurs d'une communauté de pratique recherchent parmi leurs expériences passées, des connaissances qui les amènent à lire les éléments d'une situation et agir d'une certaine façon, c'est ce qu'Argyris et Schôn (2002), appellent la réflexion dans l'action. Dans cette optique, il est possible de considérer l'apprentissage dans et par l'action à travers l'accumulation et l'interprétation des expériences individuelles et collectives détenues par les membres de l'organisation (Barbaroux et Gode, 2011).

Par l'expérience, la répétition ou l'exploitation des régularités (Koenig, 1997), les individus apprennent en améliorant constamment leurs pratiques (Sopranot et Steven, 2006) et tirer des enseignements pour les réutiliser dans des cas similaires.

I.2.4. Les routines statiques : un déterminant de l'apprentissage au sein des communautés de pratique

Dans le cadre d'une communauté de pratique, le maintien au cours du temps des expériences acquises est assuré par l'existence de routines individuelles humaines issues des expériences passées. La littérature fait ressortir les routines comme facteur déterminant dans le fonctionnement des communautés de pratique. Ce constat s'est considérablement enrichi au fil de l'étude exploratoire (2010) que nous avons effectuée. Les résultats dégagés soulignent le caractère statique des routines dans le cadre des communautés de pratique. Ces routines existantes, qui au sens de Fillol (2006) mettent en relief l'influence des expériences passées. La capacité des acteurs à mobiliser les routines statiques est en soi un savoir-faire opérationnel qui joue le rôle de véritables fondements de la communauté de pratique. Les routines, en tant que stocks de connaissances opérationnelles existantes, par leur mise en œuvre quotidienne, coordonnent les expériences passées des membres de la communauté avec son activité présente.

L'apprentissage est ainsi considéré comme une série d'ajustements des routines existantes en réponse aux situations problématiques. La répétition de la logique de résolution de problèmes sur la base de l'histoire et des expériences passées est ainsi privilégiée, dans la mesure où elle permet de réduire le temps de réponse et de faire l'économie d'une activité cognitive assez pesante pour les acteurs (Leroy et Ramanantsoa, 1996).

I.2.5. Optimisation de l'existant et circulation horizontale des connaissances

Depuis les travaux fondateurs de Lave et Wenger (1990), les communautés de pratique ont été avancées comme un lieu de circulation de connaissances tacites à travers l'optimisation des connaissances et compétences existantes pour renforcer les pratiques existantes. Le mode de création de connaissances s'apparente davantage à un mode de conversion de type socialisation (Nonaka et Takeuchi, 1997). La création de connaissances est un résultat largement involontaire (Créplet et al., 2000). Les communautés de pratique se situent clairement dans une logique d'utilisation des connaissances et compétences existantes (Bontis et al., 2002 ; Holmqvist, 2009). Ses acteurs se contentent d'utiliser au mieux les ressources et les compétences existantes dans une volonté de normalisation des comportements, d'anticipation du risque de volatilité des connaissances (Grimand, 2006).

L'apprentissage par exploitation est, décrit par des mécanismes qui améliorent les compétences existantes (Gatignon et al., 2002). March (1991) souligne que, l'exploitation porte sur ce qu'il appelle « the use of known solutions ». Dans cette optique, les communautés de pratique ayant pour objectif le développement des compétences et connaissances existantes propres à l'exercice de la pratique, favorisent un mode d'apprentissage par exploitation. Un mode permettant de construire, renforcer et pérenniser les compétences nécessaires à l'exercice de la pratique considérée (Lave et Wenger, 1990). Ces activités d'optimisation, d'amélioration et d'extension des compétences existantes, ainsi que l'utilisation et le raffinage de la connaissance existante représentent simultanément une caractéristique des communautés de pratique et un pilier d'apprentissage par exploitation.

Bartalier et Dupouet (2008), soutiennent que les communautés de pratique sont orientées vers l'exploitation, assurant une circulation horizontale des connaissances entre entités opérationnelles. Les afflux de connaissances horizontaux des membres sont associés à la connaissance venant de ce qui est égal dans une même structure, comme le soulignent Mom et al. (2006). Ces auteurs avancent que l'échange horizontal de connaissances a lieu entre des divisions, entre des unités opérationnelles et entre des unités d'exploitation. La circulation horizontale de connaissances permet d'améliorer des tâches plutôt analysables, claires et des problèmes associés. L'apprentissage par exploitation sert dans

ce cas, de canal de circulation horizontale des connaissances tacites existantes, essentiellement associées à la pratique.

I.2.6. L'efficacité de la capacité d'absorption dans le cadre des communautés de pratique

Van Den Bosch et ses collègues (1999) soutiennent l'idée que l'efficacité d'une capacité d'absorption touche positivement les adaptations et les activités d'exploitation. Jeremy (2011), souligne que la capacité d'absorption dépend du niveau antérieur des connaissances acquises par l'entreprise et l'importance de la connaissance préalable dans la formation de nouveaux savoirs ainsi que l'amélioration mutuelle de l'apprentissage dans des domaines similaires. Ces enseignements théoriques ainsi que ceux inhérents de notre exploration, mettent en exergue que les communautés de pratique poursuivent essentiellement des tâches d'exploitation. Un champ de l'utilisation de ce qui existe, peut provoquer un manque d'assimilation inhibant à son tour l'adoption de meilleures pratiques, et limitant, le développement de la capacité d'absorption et donc l'apprentissage à l'adaptation. Le travail des communautés de pratique repose sur un répertoire de routines statiques, qui se réfèrent à des stocks de connaissances opérationnelles existantes. Leur mise en œuvre coordonne des expériences passées homogènes qui, désormais, restreignent l'éventail des réponses et affecte de manière directe le degré de développement de la capacité d'absorption de ses acteurs.

I.2.7. Les communautés de pratique : un champ d'apprentissage par exploitation

Le constat que les communautés de pratique représentent une opportunité d'apprentissage par exploitation, s'est considérablement enrichi au fil des paragraphes précédents. D'autres recherches reconnaissent également cette démarcation de l'apprentissage : apprentissage par l'expérience (Koenig, 1997), apprentissage adaptatif (Cyert et March, 1963), routinier à la recherche de l'efficacité par la répétition à l'identique sans remettre en cause les normes et les valeurs de base (Kim, 1993), un apprentissage expérientiel par l'action et la socialisation (Soulier, 2005). Toutes ces qualifications attribuées et caractéristiques relevées renvoient à l'exploitation, que Argyris et Schôn (2002) assimile à la simple boucle d'apprentissage. L'apprentissage simple boucle consiste, lorsqu'un dysfonctionnement est constaté, à réadapter les pratiques à la théorie affichée (Argyris et Schôn, 2002). Il concerne essentiellement la production de connaissances tacites (Leroy, 1998), dont la principale caractéristique est traduite par leur pertinence opérationnelle dans la pratique. Cette voie d'apprentissage est, principalement liée à la révision et l'interrogation des pratiques courantes. Ce processus correctif fait d'ajustements réguliers, amène à les retoucher en fonction de la capacité des acteurs à réduire l'écart entre le résultat et l'objectif. Dans ce cas, les acteurs apprennent dans une succession d'erreurs et d'essais par réplication (Sopranot et Steven, 2006). Il s'agit d'un apprentissage opérationnel où les expériences précédentes prévalent et les solutions adéquates relevant du passé sont réutilisées dans des situations différentes (Levitt et March, 1988). Il suffit là où l'on peut rectifier les erreurs. Une sorte de résolution des problèmes installés dans l'action (Argyris, 1995) répondant aux besoins et l'objectif des communautés de pratique qui sont à la recherche de l'efficacité à travers leur pratique pour une meilleure pertinence opérationnelle.

Les communautés de pratique sont donc, comme le soutiennent Bartalier et Dupouet (2008), orientées vers l'exploitation ayant pour fonction de renforcer les pratiques existantes. Cependant, le caractère adaptatif de la démarche poursuivie favorise un mode d'apprentissage adaptatif (Merindol, 2006). Leurs caractéristiques ne permettent pas d'aller au-delà de l'adaptation, et l'apprentissage par exploitation. Sous l'éclairage de cette analyse, nous postulons que : Les communautés de pratique favorisent le développement d'un apprentissage par exploitation.

I.3. Les déterminants et les types d'innovation dans le cadre des communautés de pratique

Les entreprises sont incitées à innover afin de garantir leur compétitivité (Deltour et al, 2014). La conceptualisation de l'innovation dans une économie fondée sur la connaissance repose sur les capacités et les compétences organisationnelles. Pour innover, l'interaction est avantageuse pour exploiter l'existant et explorer de nouvelles conceptions. Les communautés de pratique semblent

ainsi être plus aptes à supporter ou mieux faire certains des processus fondamentaux d'exploitation (Baslé et Renault, 2004 ; Noteboom, 2006). Nous considérons ainsi que le processus d'apprentissage basé sur l'exploitation est un déclencheur d'innovation à partir des objectifs poursuis par la communauté de pratique.

I.3.1. L'objectif d'efficacité actuelle et le mode d'innovation résultant

Si nous retenons la conceptualisation de l'innovation comme reposant sur les compétences organisationnelles générées au sein d'une communauté de pratique, l'innovation est le résultat de l'agrégation des connaissances et expériences directement praticables dans l'apprentissage et plus particulièrement la résultante de l'exploitation et l'optimisation des compétences existantes. Nous supposons, comme l'indiquent Berson et al. (2006), que l'exploitation porte sur la recherche de la fiabilité. Elle incorpore l'apprentissage de routines standards, le transfert de connaissances existantes et l'adaptation progressive.

I.3.1.1. L'exploitation des expériences passées et l'optimisation de l'existant : source d'amélioration dans les communautés de pratique

Les acteurs d'une communauté de pratique apprennent par l'expérience. L'apprentissage basé sur l'expérience passée est centré sur l'acteur et implique la réflexion personnelle sur une expérience passée. Il fait, ainsi, appel à des activités réelles vécues auparavant résultant d'un apprentissage inférant, opérationnel pouvant s'appliquer à d'autres situations problématiques. L'observation sur l'expérience vécue implique, dans ce cas, l'ensemble des connaissances et compétences existantes sur le plan opérationnel de la communauté. Ce qui permet de réaliser une performance à court terme. La priorité est alors accordée à l'efficacité actuelle. Dans ce cas, la création d'un nouveau savoir (connaissance/compétence) passe au second plan des « best practices » d'hier à aujourd'hui (Szylar, 2006). Son but est de mettre en œuvre d'actuelles compétences plutôt que d'en développer de nouvelles. La simple reproduction des compétences acquises dans le passé ne peut être que source d'amélioration. Une amélioration reposant sur l'efficacité de l'intégration de la compétence existante et servant de base à des décisions pour des fins d'exploitation, d'amélioration des conceptions établies, au-delà d'extension des produits et des services existants. Ces caractéristiques s'appliquent, essentiellement, aux spécificités d'une innovation d'exploitation. Les travaux de Danneels (2002) et ceux de Benner et Tushman (2003) soulignent que, l'innovation d'exploitation est celle qui repose sur l'utilisation des capacités et des routines organisationnelles existantes de l'entreprise. Elle implique l'utilisation des connaissances et compétences existantes dans des processus de production existants, supposant ainsi l'amélioration continue des pratiques et processus via des mécanismes de changements incrémentaux (Noteboom, 2006). Cette conception de l'innovation d'exploitation permet de l'envisager comme une activité qui consiste à employer efficacement les actifs et compétences circulant, nécessaires pour survivre à court terme (Noteboom, 2004).

I.3.1.2. Capacité d'absorption et ampleur de l'innovation

Dans le cadre d'une communauté de praticiens, l'innovation est le fait de l'intérieur, le résultat interne d'un travail collectif d'acquisition de connaissances locales et similaires. La capacité d'absorption des acteurs détermine, ainsi, l'ampleur, la vitesse et la fréquence de l'innovation. En effet, les connaissances et compétences détenues par les acteurs sont essentiellement homogènes axées sur un domaine particulier. Dans cette optique, leur capacité d'absorption peu développée a un impact direct sur la capacité d'innovation. Alors que l'intégration des connaissances fait partie intégrante du processus de développement de nouveaux produits, l'homogénéité des acteurs qui appartiennent à des univers cognitifs communs, et qui partagent un répertoire de connaissances commun, réduit l'ampleur de l'innovation à des résultats mineurs. Szulanski (2000) souligne que le manque d'assimilation peut inhiber le transfert et l'adoption de meilleures pratiques et donc l'apprentissage, au-delà l'innovation.

I.3.2. Stabilité et adaptabilité

L'apprentissage généré au sein d'une communauté de pratique repose sur la répétition et l'adaptation, garantissant une certaine stabilité des routines statiques. Ces dernières forment les compétences d'individus et représentent les règles générales qui constituent la mémoire de la communauté (Reynaud, 2000). L'activité d'une communauté de pratique liée à l'innovation est donc déterminée par certains critères relativement stables pour évaluer les changements proposés dans les routines. L'effort de résolution de problème tombe dans des modèles de routines fixes, anticipées à partir des expériences passées à travers des efforts de résolution de problèmes similaires. Ce mode d'apprentissage moins adapté à des espaces évolutifs, ne peut que contribuer à l'innovation d'exploitation, ayant pour objectif d'introduire des modifications mineures ou épidermiques dans l'offre existante (Liouville, 2009) pour des fins d'adaptation.

I.3.4. Les changements incrémentaux et l'activité d'exploitation au sein des communautés de pratique

L'exploitation désigne ce qui est incrémentale, soient des améliorations sur les designs dominants existants (Nooteboom et al., 2005). Elle implique l'utilisation des compétences existantes dans des processus de production existants et suppose l'amélioration continue des pratiques et processus via des mécanismes de changements incrémentaux (Noteboom, 2006). L'amélioration renvoie ainsi à des changements incrémentaux, à travers lesquels, les acteurs cherchent à s'adapter à l'environnement actuel et maximiser la performance actuelle. Les communautés de pratique en tant que lieu de socialisation, sollicite un apprentissage qui repose sur l'utilisation, le raffinement des connaissances et compétences existantes (Levinthal et March, 1993), la répétition des routines statiques anticipées des expériences passées et la concentration sur la production d'un changement plutôt incrémental (Tushman et O'Reilly, 1996). Ce type d'apprentissage poursuit un objectif d'alignement et d'adaptabilité, impliquant comme le souligne Lennox et King (2004), une correspondance à la connaissance en réponse au statut de l'environnement permettant de générer des améliorations mineures.

L'acquisition de connaissances locales vieilles stimulent l'exploitation (Bennet et Tushman, 2002 ; Katila et Ahuja, 2002 ; Nerkar, 2003 ; Rosenkopf et Nerkar, 2001 ; cité par Mom et al., 2006). Une communauté de pratique cherche donc de préserver le statu quo. Cette recherche de l'efficacité actuelle implique la recherche continue d'améliorations dans un ensemble de conditions initiales où il s'agit d'affiner des produits, processus ou des capacités, existants. En effet, l'exploitation s'appuie sur une structure stable garantissant la réalisation répétitive des opérations, l'apprentissage par exploitation permet d'obtenir des gains à court terme, demeurant peu importants en termes d'innovation. Les modalités de développement des connaissances et compétences revêtent, dans ce cas, les caractéristiques d'une innovation d'exploitation traduite par des simples améliorations incrémentales. Nous admettons ainsi que les communautés de pratique sont sources d'innovation d'exploitation, à travers le développement d'un apprentissage par exploitation. Ses caractéristiques et les modalités d'apprentissage ne permettent pas d'aller au-delà de l'exploitation.

II. Méthodologie

Cette étude qualitative exploratoire s'inscrit dans le paradigme interprétativiste. Nous avons adopté une démarche abductive. Nous avons depuis le début, procédé à des allers et retours entre la théorie et le terrain. Nous avons mené une étude de cas multiples auprès du secteur bancaire Tunisien. Notre exploration a porté sur six communautés de pratique identifiées dans six banques Tunisiennes privées et à majorité étrangère. Ces banques sont caractérisées de porteurs pour l'établissement de ce genre de regroupement informel à travers le développement d'une culture de partage, des interactions sociales, d'une confiance mutuelle et des routines organisationnelles. Nous avons réalisé des investigations en se basant principalement sur la technique de l'entrevue semi directif (avec un premier responsable membre de la communauté), l'observation non participante et la documentation. Et nous avons réalisé une analyse thématique à l'aide de Nvivo 7.

III. Résultats et Discussion : Analyse de la Relation Communautés de Pratique, Apprentissage et Innovation dans les Banques Tunisiennes

Nous revenons tout d'abord sur le mode d'apprentissage pratiqué au sein des communautés de pratique identifiées. Ensuite, nous analysons sa contribution à l'innovation.

III.1. L'appréhension de l'apprentissage à travers les communautés de pratique identifiées

Notre analyse auprès des banques explorées, nous a permis de relever l'existence de six communautés de pratique qui répondent aux critères d'identification soulevés de la littérature. Ces communautés ont montré un fonctionnement conforme aux concepts développés par Wenger. Les membres des communautés de pratique, se fixent des objectifs et cherchent à les atteindre. Ils participent librement à l'activité communautaire en se basant essentiellement sur un processus d'échange volontaire.

III.1.1. Communauté de pratique et apprentissage par exploitation

Les résultats induits par notre analyse, montrent que généralement les communautés de pratique favorisent le développement d'un apprentissage par exploitation. L'exploration des communautés de pratique identifiées permet de réconforter les prédictions théoriques à l'exception d'une seule communauté de pratique (cas 5) dont l'analyse a révélé qu'elle était capable d'atteindre l'exploration en termes d'apprentissage.

Les communautés de pratique, objet de notre étude, définissent leurs objectifs pour une meilleure démarche d'apprentissage comme suit :

- Assurer une meilleure représentation des experts et connaisseurs du domaine ; améliorer la connaissance mutuelle dans la banque (savoir qui sait quoi)
- consolider les connaissances des membres existants
- renforcer les liens interactionnels par le biais de la pratique
- Favoriser le partage d'expériences et des savoirs faire métiers
- Créer des connaissances contextualisées ; augmenter les compétences dans la pratique
- Résoudre des problèmes ; éviter la duplication des erreurs
- Accéder aux connaissances de référence.

L'objectif du regroupement informel est d'être un véritable appui à la banque, afin de contribuer à l'amélioration de sa performance. Dès qu'un problème se présente, l'ensemble des acteurs se mobilisent pour trouver une réponse en fonction de leurs connaissances préalables. La routinisation de leur activité, constitue la forme la plus importante de stockage de connaissances opérationnelles. Ces communautés ont pour vocation d'assurer la convergence entre les intérêts individuels et collectifs, assurer le partage et l'exploitation des connaissances pour rendre plus efficace le processus de socialisation dans lequel les membres sont impliqués. Leurs orientations renvoient à une démarche adaptative d'apprentissage qui vise l'échange de connaissances, d'opinions, de solutions à des situations difficiles rencontrées dans leur domaine de pratique commune. Ceci leur permet de renforcer leurs connaissances existantes pour des fins d'ajustement. Les discussions conduisent à la construction progressive d'une base de connaissances communes leur permettant d'acquérir une compréhension partagée des pratiques du métier.

L'apprentissage sert de canal assurant le partage à petite échelle de connaissances opérationnelles et la réflexion quotidienne sur la pratique commune. Il consiste en un moyen d'adaptation, ou d'exploitation selon la terminologie de March (1991). Les compétences et connaissances inhérentes à des expériences passées représentent ainsi la principale source d'apprentissage dans le cadre de ces communautés de pratique. Un apprentissage réalisé de manière sociale avec l'objectif d'améliorer l'efficacité de l'action collective, de revoir de manière continue son fonctionnement. Il vise la recherche de l'efficacité pratique en répétant régulièrement le même type d'action. Dans cette optique, l'apprentissage renvoie, selon les termes d'Argyris (2002), aux situations où l'on met

en œuvre l'une des stratégies d'action disponible dans le répertoire existant, sans modifier le système d'informations en amont.

III.1.2. La contribution des communautés de pratique à l'apprentissage par exploration

Les communautés de pratique favorisent seulement le développement d'un apprentissage par exploitation comme le stipule la littérature. Cependant, nous avons remarqué que dans le cas 5, on a dépassé cette relation pour remarquer la possibilité d'une exploration même dans une communauté de pratique. Ainsi, il ressort de notre analyse que cette dernière développe aussi bien l'apprentissage par exploitation que l'apprentissage par exploration de nouvelles solutions. En effet, par expérimentation et exploration de nouvelles solutions, les acteurs de la communauté ont orienté leur effort vers l'exploration et ont généré un apprentissage par lequel des données anciennes sont combinées avec de nouvelles données et sont mises en œuvre collectivement dans des actions ou dans la préparation d'actions futures (Charreire, 2002).

Ses acteurs cherchent à apprendre pour augmenter leurs propres connaissances. En dialoguant ensemble de leur pratique, ils connectent des contenus et partagent des ressources afin de s'approprier des savoirs analogues pour enrichir les leurs et les intégrer dans leur pratique de travail. L'animateur de la communauté encourage ses collègues à s'engager continuellement dans la discussion et le partage des idées. Ces acteurs, face à une situation nouvelle, ont cherché non seulement à utiliser les connaissances existantes, mais ont été aussi capables de modifier leurs habitudes de travail. L'apprentissage est, dans ce cas, conçu comme rompant avec les hypothèses préconçues. Ainsi à travers l'engagement visible de ces acteurs ainsi que leur implication, leur participation s'est concrétisée par une production de connaissances nouvelles. Ils sont conscients que lorsque les normes acquises ne permettent plus de répondre à la situation présentée, il faut savoir modifier leur schéma d'interprétation et leur façon de penser. La combinaison des différents corps de connaissances exigent une souplesse de la part de ces acteurs qui ont fait preuve de flexibilité au niveau de leur capacité d'absorption. Le développement de capacité d'absorption (flexible) et leur capacité de rompre avec l'existant explique principalement leur contribution à l'apprentissage par exploration. Notre analyse montre également que l'interaction et l'échange entre la présente communauté de pratique avec une communauté épistémique existante dans le cas exploré (cas 5) favorise le passage d'un apprentissage par exploitation à un apprentissage par exploration.

III.2. La contribution des communautés de pratique à l'innovation

Dans le cadre de notre analyse, nous allons interpréter la contribution des communautés de pratique à l'innovation en mobilisant l'apprentissage qu'elles génèrent. Les résultats empiriques soulèvent que généralement, les communautés de pratique sont sources d'innovations d'exploitation. Cependant, et contrairement à ce qui a été relevé de la littérature, nous avons constaté certaines exceptions. Dans le cas 3, l'apprentissage mobilisé n'a pas été source d'innovation. Dans d'autres cas (2-5), ces communautés se sont révélées être sources aussi bien d'exploitation que d'exploration de nouvelles solutions.

III.2.1. Les communautés de pratique : une source d'innovation d'exploitation

Les banques sous la lumière de la concurrence dynamique, se veulent tournées vers ses acteurs pour s'adapter au contexte mouvant. Tel est le rôle des praticiens au sein des cas d'analyse 1,4, et 6**.** Les acteurs réunis autour d'une démarche de praticiens, poursuivent un objectif cognitif essentiellement orienté vers l'alimentation et la consolidation des meilleures pratiques attachées à leurs champs de compétence. Ils cherchent à faire les choses mieux sans renoncer à leurs préconçus sous-jacents. Dans cette optique, l'apprentissage généré, réfléchie sur le répertoire existant, sans modifier le système de connaissances. Du point de vue des directeurs prescrits, les connaissances et compétences développées suite à l'apprentissage permettent d'accroitre la valeur des produits et services que propose les banques. Des innovations à une échelle réduite,

essentiellement par l'accroissement de ses connaissances et compétences de base. L'innovation en question est, d'après les témoignages avancées, une amélioration incrémentale d'un produit, ou de l'une de ses composantes (caractéristiques fonctionnelles, intrinsèques, extrinsèques pour les cartes…) et qui a remporté un succès commercial rapide. Elle correspondait à l'introduction d'un service sensiblement amélioré sur le plan de ses caractéristiques ainsi que de l'usage auquel il est destiné. Aussi, elle portait sur des méthodes de travail pour mieux gérer les connaissances éparpillées dans chaque département. Ces témoignages appuyés par des exemples corroborent avec l'idée que les communautés de pratique sont sources d'innovation d'exploitation à travers le développement d'un apprentissage par exploitation.

III.2.2. L'apprentissage de la communauté de pratique identifiée dans le cas 3 : un processus non générateur d'innovation

Le directeur interrogé déclare que la résolution de problèmes est au cœur de l'apprentissage, de la pensée et du développement. Selon lui, l'apprentissage éclaircit les idées et les pensées des acteurs. Il considère que toute connaissance générée suite à l'apprentissage peut être source d'innovation. Néanmoins, cette perception ne reflète pas la contribution de la communauté de techniciens identifiée en matière d'innovation, dont l'activité est essentiellement axée sur la correction des erreurs. L'innovation ne fait pas partie de ses priorités et ses acteurs ne visent aucunement l'innovation comme objectif cognitif. L'apprentissage servait donc de simple moyen de résolution de problèmes et de réduction de la duplication des erreurs commises dans le passé. La communauté représente plutôt un système d'alerte permettant de démultiplier la capacité de ses membres à trouver des solutions aux réponses et à identifier qui sait quoi pour obtenir la réponse à leur question.

L'affaiblissement de l'apport de l'apprentissage s'explique, également, par un effort d'animation insuffisant, de plus que la communauté s'adresse à un nombre restreint d'acteurs. Nous pouvons ainsi déduire que les communautés de pratique ne sont pas sources d'innovations d'exploitation, si elles ont comme objet seulement, la résolution des problèmes liés à la pratique.

III.2.3. Les communautés de pratique : un générateur d'innovation bidimensionnelle

L'analyse des données révèle que dans le cadre des communautés de pratique identifiées dans les cas 2 et 5, les experts du domaine sont dotés d'une critique imaginative et innovatrice. L'innovation est un objectif cognitif visé. Elle commence par l'apprentissage de l'existant, comprendre les atouts de l'existant et agir pour apporter des améliorations.
Ces dernières portent sur des produits existants mais faisant la différence avec la concurrence. Les acteurs, observent, s'inspirent des modes de fonctionnement des autres banques, pour ajuster l'offre à la demande dans le contexte Tunisien. Sous l'effet de l'expérience, les membres de la communauté, cherchent à combiner des données anciennes avec d'autres nouvelles. Ces communautés étaient ainsi capables de proposer de nouvelles idées qui ont mérité l'attention de la direction. Cette connaissance nouvelle issue de la pratique été étudiée, ajustée et retenue par la direction vue son originalité.
Passionnés par leur domaine de travail, les acteurs des présentes communautés ont mobilisé toutes leurs compétences et connaissances acquises et assimilées pour évoluer dans l'entreprise. Ils ont cherché à reconnaitre de nouvelles connaissances, les assimiler et les appliquer à des fins commerciales. La flexibilité de leur capacité d'absorption a permis de générer de nouvelles connaissances. La représentation qu'ils ont fait de l'innovation ne s'est pas conformée à une logique d'exploitation. Ils ont réussi à proposer une nouvelle offre sur le marché. Ces explorations leur ont permis d'être incomparables aux autres banques. Elles n'ont pas cessé d'être améliorées par les membres de la communauté par recherche, optimisation et approfondissement de la base de connaissances. Il s'avère de ce fait que les communautés de pratique peuvent dépasser l'innovation d'exploitation pour atteindre l'exploration de nouvelles solutions. Ceci s'explique par leur volonté accrue de se développer et d'être reconnus sur le plan professionnel. De même que leur rapprochement cognitif, le développement de leur capacité d'absorption ainsi que la reconnaissance de leurs efforts par la direction qui étaient à la base de l'exploration.

Le passage d'un apprentissage par exploitation à un apprentissage par exploration justifie également les retombées en termes d'innovation dans ses deux dimensions. L'apprentissage par exploitation permet l'optimisation des connaissances et compétences dont l'appropriation et l'utilisation pouvant pousser l'exploration et inversement. Les retombées de l'exploration peuvent ainsi être consolidées par des activités d'exploitation. Par conséquent, il émerge de notre étude de l'empirie qu' au sein d'une même communauté, la complémentarité entre innovation d'exploitation et innovation d'exploration repose sur l'interaction entre les deux dimensions de l'apprentissage.

IV. Synthèse

Au terme de cette analyse qui intègre aussi bien la synthèse de la littérature et la réalité des cas étudiés, nous pouvons conclure que généralement, les communautés de pratique favorisent seulement le développement d'un apprentissage par exploitation comme le stipule la littérature. Cependant, nous avons remarqué que dans le cas 2, on a remarqué la possibilité d'une exploration même dans une communauté de pratique. Ainsi, il ressort de notre analyse que cette dernière développe aussi bien l'apprentissage par exploitation que l'apprentissage par exploration de nouvelles solutions. Contrairement à ce qui a été relevé de la littérature, les enseignements empiriques montrent aussi que, généralement, les communautés de pratique sont sources d'innovations d'exploitation. Cependant, nous avons constaté certaines exceptions. Dans certains cas, ces structures ne permettent pas l'innovation d'exploitation quand elles ont comme objet seulement, la résolution des problèmes liés à la pratique (cas 3). Dans d'autres cas, ces communautés se sont révélées être sources aussi bien d'exploitation que d'exploration de nouvelles solutions (cas 2-5). À ce propos, il convient de souligner le rôle modérateur de la direction dans la relation entre l'apprentissage et l'innovation d'exploration. La direction est le seul responsable à retenir ou non la connaissance générée par l'apprentissage pour des fins d'innovation, même si, les idées avancées sont nouvelles, sauf si elles sont exceptionnelles. Les principales contributions de notre recherche sont d'ordre managérial. Il s'agit de valoriser le rôle des communautés de pratique présentées comme les lieux privilégiés d'apprentissage d'exploitation et d'exploration. Mieux comprendre la dynamique et le fonctionnement des acteurs dans un contexte de communauté de pratique pour contribuer à l'innovation. Et finalement aider les dirigeants des banques à comprendre les défaillances de la démarche poursuivie et consolider leur mécanisme de coordination afin de tirer bénéfice des effets d'apprentissage qu'ils pourraient obtenir.

Annexe : Guide d'entretien

1- Peut-on décrire votre contexte organisationnel de porteur pour l'établissement des regroupements informels ? Veuillez citer les éléments qui sont à la base de cette description.
2- Qu'en pensez-vous des communautés regroupant des acteurs homogènes appartenant à un même domaine d'activités ?[2]
3- Pouvez-vous avancer ce qui à votre sens pourrait définir une communauté de pratique ? Comment jugez-vous l'apport et les finalités espérées ? Quelle est la valeur ajoutée de ce travail en groupe pour votre entreprise ? Quels sont les bénéfices potentiels ?
4- Veuillez appuyer vos propos par des exemples concrets ? Quelles sont les éléments qui sont à la base de votre description ?
5- Comment jugez-vous la contribution de ces communautés de pratique en termes d'apprentissage ? Veuillez expliquer ?
6- Veuillez préciser si les caractéristiques propres de ces communautés impliquent des différences au niveau du mode d'apprentissage pratiqué ?
7- Selon vos observations, au sein d'une communauté de pratique, s'agit il d'un apprentissage de type routinier capable d'amorcer des corrections nécessaires pour remédier aux écarts sur la base de compétences et connaissances existantes ; ou d'un apprentissage basé plutôt sur l'expérimentation capable de sentir, suivre et explorer de nouvelles solutions ?
8- Selon vos connaissances, de quel apprentissage peut-on parler au sein des communautés de pratique précitées ?
9- Quelles sont les modalités de fonctionnement ?
10- Pouvez-vous décrire la nature des connaissances développées suite à l'apprentissage dans chaque communauté ?

[2] Les questions sont élaborées à partir de la théorie sociale de l'apprentissage de Wenger. Nous nous sommes inspirés des grilles de lecture proposées par Cappe (2005), Lafferière (2005) ainsi que celles proposées par Langelier (2005). Nous nous sommes essentiellement inspirés de la distinction principale entre communautés de pratique et communautés épistémiques proposée par Snyder et Wenger, (2000).

11- Comment les acteurs de ces communautés de pratique parviennent à circuler les connaissances acquises et absorber les connaissances des autres membres ?
12- Comment percevez-vous le rôle de l'apprentissage dans le développement de l'innovation ?
13- Pouvez-vous décrire l'apport du mode d'apprentissage pratiqué au sein des communautés de pratique ?
14- Veuillez préciser si la capacité d'absorption des acteurs, a été capable d'appliquer la connaissance pour des fins d'exploitation ou d'exploration ?
15- L'exploration de nouvelles solutions représente le résultat d'une remise en cause des connaissances de base ou autrement ?
16- Pouvez-vous déduire si la nature de chaque communauté de pratique et le mode d'apprentissage pratiqué affecte la nature d'innovation générée ? Pouvez-vous conclure avec des exemples concrets ?
